New PDII Test Braindumps & Latest PDII Material

The clients at home and abroad can both purchase our PDII study tool online. Our brand enjoys world-wide fame and influences so many clients at home and abroad choose to buy our Platform Developer II guide dump. Our company provides convenient service to the clients all around the world so that the clients all around the world can use our PDII study materials efficiently. Our company boasts an entire sale system which provides the links to the clients all around the world so that the clients can receive our products timely. Once the clients order our PDII cram training materials we will send the products quickly by mails. The clients abroad only need to fill in correct mails and then they get our products conveniently. Our PDII cram training materials provide the version with the language domestically and the version with the foreign countries' language so that the clients at home and abroad can use our PDII study tool conveniently.

Salesforce Platform Developer II Sample Questions (Q71-Q76):

NEW QUESTION # 71

What is the transaction limit on the number of @future invocations?

- A. 0
- B. 1
- C. 2
- D. 3
- E. There is no limit

Answer: C

NEW QUESTION # 72

Universal Containers decided to use Salesforce to manage a new hire interview process. A custom object called Candidate was created with organization-wide defaults set to Private. A lookup on the Candidate object sets an employee as an Interviewer. What should be used to automatically give Read access to the record when the lookup field is set to the Interviewer user?

- A. The record can be shared using a sharing rule.
- B. The record can be shared using an Apex class.
- C. The record cannot be shared with the current setup.
- D. The record can be shared using a permission set.

Answer: A

Explanation:

A sharing rule can be used to automatically give Read access to a user specified in a lookup field. Sharing rules are declarative and can be based on criteria such as the value of a lookup field. This can be done without writing code and is maintainable through the Salesforce UI.

References: Salesforce Help - Sharing Rules

NEW QUESTION # 73

Universal Containers (UC) has an CRP system that stores customer information.

When an Account is created in Salesforce, the FRP system's REST endpoint for creating new customers must automatically be called with the Account information. If the call to the ERP system fails, the Account should still be created. Accounts in UC org are only created, one at a time, by users in the customer on-boarding department.

What should a developer to make the call to the CRP system's REST endpoint?

- A. Headless Quick Action
- B. apex Continuation
- C. REST call from JavaScript
- D. call a Queueable from a Trigger

Answer: D

Explanation:

According to 1, REST API provides you with programmatic access to your data in Salesforce. You can use REST API to make HTTP requests to Salesforce endpoints and perform operations on your data. However, you also need to authenticate your requests using OAuth endpoints 2.

According to 3, you can use Queueable Apex to schedule batch send the data from Salesforce to another system using REST API. Queueable Apex allows you to run asynchronous jobs that can be chained and monitored. You can call a Queueable class from a trigger to enqueue the job after an Account is created.

Therefore, using a Queueable from a Trigger seems to be the best way to make the call to the ERP system's REST endpoint.

NEW QUESTION # 74

A developer created a new trigger that inserts a Task when a new Lead is created. After deploying to production, an outside integration is periodically reporting errors.

Which change should the developer make to ensure the integration is not affected with minimal impact to business logic?

- A. Use a Try/Catch block after the insert statement.
- B. Deactivate the Trigger before the Integration runs.
- C. Use the Database method with allOrNone set to False.
- D. Remove the Apex Class from the Integration User's Profile.

Answer: C

NEW QUESTION # 75

Consider the following code snippet:

```
HttpRequest req = new HttpRequest();
req.setEndpoint('https://TestEndpoint.example.com/some_path');
req.setMethod('GET');
Blob headerValue = Blob.valueOf('myUserName' + ':' + 'strongPassword');
String authorizationHeader = 'Basic ' + EncodingUtil.base64Encode(headerValue);
req.setHeader('Authorization', authorizationHeader);
Http http = new Http();
HTTPResponse res = http.send(req);
```

Choose 2 answers

- A. Store the URL of the endpoint in a custom Label named endpointURL.
- B. Use req.setEndpoint(Label.endpointURL);
- C. Use req.setEndpoint('callout: endpoint_NC'); within the callout request.
- D. Create a Named Credential, endpoint_NC, to store the endpoint and credentials.

Answer: A,C

Explanation:

The two changes that the developer should implement in the Apex class to ensure the LWC can display data efficiently while preserving security are to store the URL of the endpoint in a custom Label named endpointURL, and to use req.setEndpoint('callout: endpoint_NC'); within the callout request. Storing the URL of the endpoint in a custom Label allows the developer to avoid hard-coding the URL in the Apex code, and to manage the URL value from the Setup menu. This makes the code more maintainable and flexible, and also prevents exposing the URL to unauthorized users. Using req.setEndpoint('callout: endpoint_NC'); within the callout request allows the developer to use a Named Credential to store the endpoint and the credentials for the external system. This simplifies the authentication process, and also ensures that the credentials are secure and encrypted. The setEndpoint() method accepts a callout: prefix followed by the name of the Named Credential to use for the callout request. The getSubjectType() method is not a valid answer, as it is used to get the subject type of a Platform Event, but it does not affect the efficiency or security of the data display. The WHERE clause is not a valid answer, as it is used to filter the records in a SOQL query, but it does not affect the efficiency or security of the data display.
