Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q79-Q84):

NEW QUESTION # 79

When is the onCompletion() method called?

```
private class ProducerCallback implements Callback {
    @Override
    public void onCompletion(RecordMetadata recordMetadata, Exception e) {
        if (e != null) {
            e.printStackTrace();
        }
    }
}
ProducerRecord<String, String> record =
new ProducerRecord<>("topic1", "key1", "value1");
producer.send(record, new ProducerCallback());
```

- A. When the message is partitioned and batched successfully
- B. When message is serialized successfully
- **C. When the broker response is received**
- D. When send() method is called

Answer: C

Explanation:

Callback is invoked when a broker response is received.

NEW QUESTION # 80

To transform data from a Kafka topic to another one, I should use

- **A. Kafka Streams**
- B. Kafka Connect Sink
- C. Consumer + Producer
- D. Kafka Connect Source

Answer: A

Explanation:

Kafka Streams is a library for building streaming applications, specifically applications that transform input Kafka topics into output Kafka topics

NEW QUESTION # 81

Match the topic configuration setting with the reason the setting affects topic durability.

(You are given settings like `unclean.leader.election.enable=false`, `replication.factor`, `min.insync.replicas=2`)

Answer:

Explanation:

- * `unclean.leader.election.enable=false`# Prevents data loss by only considering in-sync replicas when rebalancing.
 - * `replication.factor`# Specifies how many redundant copies of partitions are distributed across brokers.
 - * `min.insync.replicas=2`# Sets the standard for the number of partition instances that must keep up with the latest committed message.
 - * `unclean.leader.election.enable=false` ensures that only in-sync replicas can be elected as leaders. If disabled, an out-of-sync replica may become leader, potentially leading to data loss.
 - * `replication.factor` defines how many brokers will maintain copies of each partition, directly impacting durability and availability.
 - * `min.insync.replicas` determines how many replicas must acknowledge a write when `acks=all` is used, enforcing write durability.

NEW QUESTION # 82

Suppose you have 6 brokers and you decide to create a topic with 10 partitions and a replication factor of 3.

The brokers 0 and 1 are on rack A, the brokers 2 and 3 are on rack B, and the brokers 4 and 5 are on rack C.

If the leader for partition 0 is on broker 4, and the first replica is on broker 2, which broker can host the last replica? (select two)

- A. 0
- B. 1
- C. 2
- D. 3
- E. 4
- F. 5

Answer: E,F

Explanation:

When you create a new topic, partitions replicas are spread across racks to maintain availability. Hence, the Rack A, which currently does not hold the topic partition, will be selected for the last replica

NEW QUESTION # 83

In Avro, removing or adding a field that has a default is a __ schema evolution

- A. breaking
- B. forward
- C. backward
- D. full

Answer: D

Explanation:

Clients with new schema will be able to read records saved with old schema and clients with old schema will be able to read records saved with new schema.
