IBM watsonx Generative AI Engineer - Associate Sample Questions (Q127-Q132):

NEW QUESTION # 127

In which scenario would using a soft prompt be more beneficial than a hard prompt in optimizing generative AI outputs?

- A. When the task requires explicit and consistent user instructions to ensure deterministic outcomes.
- B. When the model needs to generate a strictly factual output with minimal deviation from the prompt.
- C. When the prompt needs to be manually adjusted by the user in real time during interaction with the AI.
- D. When fine-tuning a pre-trained model for domain-specific tasks, allowing the system to adapt its understanding through learned embeddings.

Answer: D

NEW QUESTION # 128

When selecting parameters to optimize a prompt-tuned model experiment in IBM watsonx, which parameter is the most critical for controlling the model's ability to generate coherent and contextually accurate responses?

- A. Batch size
- B. Dropout rate
- C. Learning rate
- D. Gradient clipping

Answer: C

NEW QUESTION # 129

You are tasked with optimizing a prompt-tuned large language model (LLM) using IBM Watsonx for a customer service chatbot. The chatbot needs to handle a variety of tasks, such as answering frequently asked questions (FAQs), providing detailed product descriptions, and troubleshooting user issues.

What is the most appropriate task to focus on during the initial tuning experiment?

- A. Optimize the model for extractive question-answering from a predefined knowledge base.
- B. Tune the model for text summarization, condensing user queries into shorter forms.
- C. Fine-tune the model to generate product descriptions using longer contextual prompts.
- D. Focus on prompt-tuning the model for multi-turn dialogue to simulate more natural conversations.

Answer: A

NEW QUESTION # 130

When addressing bias in a generative AI model, which of the following strategies is least likely to be effective in reducing biased outputs during text generation?

- A. Using temperature control during generation to manage diversity in responses
- B. Training the model on a diverse and representative dataset
- C. Incorporating fairness constraints during the model's training phase
- D. Leveraging prompt rephrasing techniques to remove bias-inducing keywords or phrases

Answer: A

NEW QUESTION # 131

You are tasked with reconstructing a prompt used in an AI-based customer support chatbot. The current prompt generates lengthy, detailed answers that are often overly verbose and unnecessary for the customer's inquiries. Your objective is to optimize this

prompt to reduce model usage costs without compromising the quality of the responses.

Which of the following strategies is the most effective in reducing the cost of using a Generative AI model while maintaining response relevance and clarity?

- A. Using temperature scaling to increase randomness and reduce token usage.
- **B. Revising the prompt to make it more specific by narrowing the scope of expected responses.**
- C. Reducing the token limit in the model configuration to restrict the length of responses.
- D. Splitting the prompt into multiple sub-prompts to generate responses for different sections separately.

Answer: B
