## IICRC Water Damage Restoration Technician (WRT) Sample Questions (Q57-Q62):

### NEW QUESTION # 57

Which of the following is a benefit of a low-grain refrigerant (LGR) dehumidifier?

- A. It can operate efficiently above 110°F
- **B. It reduces vapor pressure lower than a conventional dehumidifier**
- C. It reduces vapor pressure lower than a desiccant dehumidifier
- D. It operates down to 0°F (-17°C)

**Answer: B**

Explanation:

The IICRC WRT body of knowledge explains that low-grain refrigerant (LGR) dehumidifiers are designed to remove moisture more efficiently at lower humidity ratios than conventional refrigerant dehumidifiers. As a result, LGR units can reduce air vapor pressure to lower levels than standard refrigerant systems under similar conditions.

This enhanced capability allows LGR dehumidifiers to continue removing moisture even as the environment becomes drier, supporting faster and more complete drying. The WRT manual highlights this feature as a key advantage of LGR technology in most residential and light commercial drying scenarios.

LGR units do not operate effectively at freezing temperatures, are not optimized for extreme heat, and cannot achieve vapor pressure levels lower than desiccant systems. Desiccants remain superior for very low humidity or low-temperature conditions. Therefore, the correct benefit under WRT guidance is the ability of LGR dehumidifiers to reduce vapor pressure lower than conventional refrigerant dehumidifiers.

### NEW QUESTION # 58

What is the most likely result when the rate of evaporation is greater than the rate of dehumidification?

- **A. An increased potential for secondary damage**
- B. An increased rate of drying hygroscopic materials
- C. A reduction of the ambient humidity ratio
- D. A reduction of the vapor pressure in the air

**Answer: A**

Explanation:

When evaporation outpaces dehumidification, the IICRC WRT body of knowledge explains that moisture accumulates in the air, increasing humidity ratio, vapor pressure, and relative humidity. This condition can stall drying and significantly increase the risk of secondary damage.

Excess moisture in the air can migrate into unaffected hygroscopic materials, cause condensation on cooler surfaces, and promote microbial growth. The WRT manual stresses that evaporation and dehumidification must be balanced so that moisture removed from materials is promptly removed from the air.

Rather than reducing humidity or vapor pressure, insufficient dehumidification leads to moisture saturation of the air, undermining the drying process. Monitoring psychrometric conditions allows restorers to correct imbalances before secondary damage occurs.

### NEW QUESTION # 59

When performing the initial inspection, which of the following could help determine the perimeter of wet carpet and cushion (pad, underlay)?

- A. Use a borescope or anemometer
- B. Disengage the installation
- **C. Use an IR camera or moisture sensor**
- D. Feel the area for moisture

**Answer: C**

Explanation:

The IICRC WRT body of knowledge recommends using infrared (IR) cameras and moisture sensors to help determine the perimeter of wet carpet and cushion during the initial inspection. These tools allow restorers to quickly and non-destructively identify moisture

patterns across large areas.

IR cameras can highlight temperature anomalies caused by evaporative cooling, while moisture sensors provide confirmation of moisture presence beneath carpet surfaces. The WRT manual stresses that IR imaging must always be verified with moisture detection instruments to avoid false positives.

Disengaging carpet or relying on touch is invasive, time-consuming, and unreliable. Borescopes and anemometers are not designed for carpet moisture detection.

Using appropriate detection tools supports accurate scoping, efficient drying design, and defensible documentation-core principles of professional restoration practice under the IICRC WRT standard.

#### NEW QUESTION # 60

Which device is used to measure the temperature and relative humidity of the air?

- A. A moisture sensor
- B. A thermometer
- C. A moisture meter
- **D. A thermo-hygrometer**

**Answer: D**

Explanation:

A thermo-hygrometer is the instrument identified in the IICRC WRT body of knowledge for measuring both air temperature and relative humidity. These two measurements are fundamental inputs for psychrometric evaluation and drying documentation.

The WRT curriculum explains that accurate air readings allow restorers to calculate additional psychrometric values such as humidity ratio, dew point, and vapor pressure-either manually or using built-in instrument calculations. These values are critical for assessing drying conditions, equipment performance, and the effectiveness of the drying strategy.

Moisture meters and moisture sensors are used to measure moisture in materials, not air. A thermometer measures temperature only and cannot determine moisture content or humidity conditions. The thermo-hygrometer integrates both functions into a single instrument, making it a required tool for daily monitoring under the WRT standard of care.

The WRT manual further stresses consistency in air measurements, recommending similar measurement locations and procedures during each monitoring visit to ensure defensible documentation.

#### NEW QUESTION # 61

Before a technician wears a respirator, what is an employer required to provide?

- **A. Medical evaluation, fit-testing, and proper training**
- B. Select the proper color based on relative humidity levels
- C. Nothing else is needed if the employee has no medical restrictions
- D. Have the owner check out available masks to the employees

**Answer: A**

Explanation:

The IICRC WRT body of knowledge aligns with OSHA respiratory protection standards, which require that employers provide a medical evaluation, fit-testing, and proper training before an employee wears a respirator. These requirements ensure that respirator use does not endanger the worker and that the equipment provides effective protection.

A medical evaluation determines whether the employee can safely wear a respirator without compromising health. Fit-testing ensures the respirator forms an effective seal to the user's face, which is essential for respiratory protection. Training educates workers on proper use, limitations, maintenance, and storage of respiratory equipment.

The WRT manual emphasizes that respirators are ineffective without proper fit and training, and improper use can create a false sense of security. Color selection or informal distribution of masks does not meet regulatory or professional standards.

Compliance with these requirements is mandatory when respirators are required due to airborne contaminants, sewage exposure, or mold conditions. This reinforces the WRT priority of worker safety and regulatory compliance.
