CrowdStrike CCCS-203b Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Cloud Account Registration: This domain focuses on selecting secure registration methods for cloud environments, understanding required roles, organizing resources into cloud groups, configuring scan exclusions, and troubleshooting registration issues.
Topic 2	<ul style="list-style-type: none"> • Findings and Detection Analysis: This domain covers evaluating security controls to identify IOMs, vulnerabilities, suspicious activity, and persistence mechanisms, auditing user permissions, comparing configurations to benchmarks, and discovering unmanaged public-facing assets.
Topic 3	<ul style="list-style-type: none"> • Falcon Cloud Security Features and Services: This domain covers understanding CrowdStrike's cloud security products (CSPM, CWP, ASPM, DSPM, IaC security) and their integration, plus one-click sensor deployment and Kubernetes admission controller capabilities.
Topic 4	<ul style="list-style-type: none"> • Runtime Protection: This domain focuses on selecting appropriate Falcon sensors for Kubernetes environments, troubleshooting deployments, and identifying misconfigurations, unassessed images, IOAs, rogue containers, drift, and network connections.
Topic 5	<ul style="list-style-type: none"> • Remediating and Reporting Issues: This domain addresses identifying remediation steps for findings, using scheduled reports for cloud security, and utilizing Falcon Fusion SOAR workflows for automated notifications.
Topic 6	<ul style="list-style-type: none"> • Pre-Runtime Protection: This domain covers managing registry connections, selecting image assessment methods, and analyzing assessment reports to identify malware, CVEs, leaked secrets, Dockerfile misconfigurations, and vulnerabilities before deployment.

CrowdStrike Certified Cloud Specialist Sample Questions (Q317-Q322):

NEW QUESTION # 317

What is the potential impact if CrowdStrike IP addresses are not added to your container registry allowlist for image assessment?

- A. Image assessment will fail, but other CrowdStrike services will continue to function.
- B. Image assessment will continue without any issues due to fallback IP detection.
- C. Image assessment will proceed with reduced capabilities.
- D. CrowdStrike will switch to a default public IP to bypass the restriction.

Answer: A

Explanation:

Option A: This is incorrect because CrowdStrike does not use fallback public IPs to bypass restrictions. The exact IP addresses provided in the CrowdStrike Console must be allowlisted.

Option B: This is correct because failing to allowlist CrowdStrike IP addresses specifically affects the image assessment functionality. Other CrowdStrike services that do not rely on the registry allowlist may continue to operate normally.

Option C: This is incorrect because CrowdStrike does not have a fallback mechanism for IP detection in this context. The specified IP addresses must be explicitly allowlisted to enable image assessment.

Option D: This is incorrect because image assessment requires direct communication with the container registry. Without allowlisted IP addresses, the assessment will fail entirely, not operate with reduced capabilities.

NEW QUESTION # 318

A security engineer has received an alert in the CrowdStrike Falcon console indicating a misconfigured Amazon S3 bucket that is publicly accessible. To mitigate this issue and prevent unauthorized access, which of the following actions should the engineer take first?

- A. Deploy a Falcon Sensor on the S3 bucket to monitor access attempts.
- B. Enable AWS Shield Advanced to protect against Distributed Denial-of-Service (DDoS) attacks.
- C. Modify the S3 bucket permissions to restrict public access and enforce least privilege.
- D. Create a new IAM role with administrator privileges and attach it to all cloud instances.

Answer: C

Explanation:

Option A: AWS Shield Advanced protects against DDoS attacks, but it does not resolve misconfigured permissions on an S3 bucket. The root cause of the issue is excessive access permissions, not a network-based attack.

Option B: CrowdStrike Falcon sensors are deployed on cloud workloads (e.g., EC2 instances, containers) but cannot be installed on S3 buckets. Falcon Cloud Security provides visibility into misconfigurations, but the solution to this problem lies in correcting bucket policies.

Option C: Granting administrator privileges to all instances violates the principle of least privilege and increases the attack surface. Instead, access should be granted only to necessary users and services with minimal permissions.

Option D: The first step in remediating a publicly accessible S3 bucket is to modify its permissions. This includes disabling public access, reviewing and restricting IAM policies, and ensuring that only authorized users or services can access the data. CrowdStrike Falcon Cloud Security helps detect such misconfigurations, but remediation requires direct action in AWS.

NEW QUESTION # 319

A company using CrowdStrike Falcon Cloud Security wants to ensure that all container images deployed in their cloud environment are scanned for vulnerabilities before deployment.

Which image assessment policy should they implement?

- A. Enable post-deployment scanning to assess vulnerabilities after an image has already been running in production.
- **B. Enforce pre-deployment scanning to block images with critical vulnerabilities from being deployed.**
- C. Allow all container images to be deployed, regardless of vulnerabilities, but notify administrators if an image contains high-severity vulnerabilities.
- D. Only assess images manually when security teams request a scan.

Answer: B

Explanation:

Option A: Pre-deployment scanning with enforcement ensures that only secure images are deployed, blocking those with critical vulnerabilities. This helps mitigate security risks before they reach production.

Option B: While notifying administrators about vulnerabilities is useful, allowing all images regardless of severity increases risk by deploying insecure workloads.

Option C: Relying on manual assessments makes security processes inefficient and inconsistent, leading to gaps in protection.

Option D: Post-deployment scanning is useful for continuous monitoring, but it does not prevent vulnerable images from being deployed in the first place.

NEW QUESTION # 320

What is a primary benefit of using CrowdStrike's suite of cloud security products?

- A. Hunts for suspicious security control plane updates
- B. Provides a dedicated team to remediate cloud incidents
- C. Monitors file integrity and data loss prevention
- **D. Provides a comprehensive security posture by integrating visibility and prevention**

Answer: D

Explanation:

A primary benefit of CrowdStrike's cloud security suite is that it provides a comprehensive security posture by integrating visibility and prevention across cloud workloads, identities, containers, and control planes.

Falcon Cloud Security unifies CSPM, workload protection, container security, identity protection, and detection and response into a single platform. This integration allows organizations to detect misconfigurations, prevent risky deployments, monitor runtime activity, and respond to threats using shared context and intelligence.

Other options describe isolated capabilities or services that are not the core value proposition of the platform.

Therefore, the correct answer is Provides a comprehensive security posture by integrating visibility and prevention.

NEW QUESTION # 321

Which of the following scenarios represents a security risk that CrowdStrike Identity Analyzer (CIEM) is designed to identify and

address?

- A. A serverless function has a concurrency limit set to 100 executions
- **B. An IAM role with permissions to delete all cloud resources is assigned to multiple non-human identities**
- C. An encrypted storage bucket is accessed by an authorized application
- D. A network security group is configured to allow inbound traffic on port 443

Answer: B

Explanation:

Option A: Allowing inbound traffic on port 443 (HTTPS) is a standard practice for secure web services. While this could be a misconfiguration if unnecessary, it falls under network security rather than identity management, which is the focus of CIEM.

Option B: Concurrency settings relate to resource performance and scalability, not identity or entitlement management. CIEM does not monitor or manage execution limits for serverless functions.

Option C: CIEM is specifically designed to detect and analyze overly permissive roles and identities, particularly when sensitive permissions (like resource deletion) are assigned to multiple non-human identities. This scenario poses a significant security risk if those identities are compromised or misused.

Option D: This is an expected and secure behavior when proper access policies are in place.

CIEM would not flag this as an issue since the access is authorized and aligns with standard operational practices.
