Trustworthy Analytics-Arch-201 Exam Torrent | Analytics-Arch-201 Valid Exam Pass4sure

The Salesforce Certified Tableau Architect Analytics-Arch-201 certification provides both novices and experts with a fantastic opportunity to show off their knowledge of and proficiency in carrying out a particular task. With the Salesforce Analytics-Arch-201 exam, you will have the chance to update your knowledge while obtaining dependable evidence of your proficiency. You can also get help from actual Salesforce Certified Tableau Architect Analytics-Arch-201 Exam Questions and pass your dream Salesforce Certified Tableau Architect Analytics-Arch-201 certification exam.

Salesforce Analytics-Arch-201 Exam Syllabus Topics:

Topic	Details
Topic 1	• Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.
Topic 2	• Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.
Topic 3	• Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.

Analytics-Arch-201 Valid Exam Pass4sure | Exam Analytics-Arch-201 Exercise

First and foremost, even though our company has become the staunch force in this field for almost ten years and our Analytics-Arch-201 exam questions have enjoyed such a quick sale in the international market we still keep an affordable price for our customers. Second, we have prepared free demo in this website for our customers to have the first-hand experience of the Analytics-Arch-201 Latest Torrent compiled by our company before making their final decision. So do not hesitate any more, just hurry up to buy our Analytics-Arch-201 test question which will never let you down.

Salesforce Certified Tableau Architect Sample Questions (Q109-Q114):

NEW QUESTION # 109
In a Tableau Server deployment using a load balancer, what configuration is necessary to ensure SSL (Secure Socket Layer) encryption is effectively implemented?

- A. The load balancer should be configured to bypass SSL for internal network traffic
- B. SSL certificates should be installed on each individual Tableau Server node
- C. SSL termination must be configured at the load balancer level
- D. A single SSL certificate must be shared between the load balancer and the Tableau Server

Answer: C

Explanation:
SSL termination must be configured at the load balancer level Configuring SSL termination at the load balancer level is essential in a Tableau Server deployment. This setup enables the load balancer to decrypt incoming SSL traffic and then distribute the requests across the server nodes. This approach simplifies SSL management and ensures secure communication between clients and the load balancer. Option B is incorrect because installing SSL certificates on each node is redundant and less efficient when SSL termination is handled at the load balancer. Option C is in-correct as bypassing SSL for internal traffic can compromise security, particularly for sensitive data. Option D is incorrect because sharing a single SSL certificate between the load balancer and Tableau Server is not a standard or recommended practice; the focus should be on SSL termination at the load balancer.

NEW QUESTION # 110
When troubleshooting Connected App authentication issues in Tableau Server, what factor should be primarily investigated?

- A. The correctness and validity of the client credentials used by the connected app
- B. The version compatibility of Tableau Server with the connected app
- C. The speed and stability of the internet connection between the connected app and Tableau Server
- D. The frequency of data synchronization between the connected app and Tableau Server

Answer: A

Explanation:
The correctness and validity of the client credentials used by the connected app A common area to focus on when troubleshooting Connected App authentication issues is the correctness and validity of the client credentials (client ID and secret). Incorrect or expired credentials can prevent the connected app from authenticating with Tableau Server, leading to access issues. Ensuring that these credentials are correct and up-to-date is crucial for resolving authentication problems. Option A is incorrect because while internet connectivity is important, it is not typically the primary cause of authentication issues. Option C is incorrect as version compatibility, although important, is less likely to be the direct cause of authentication problems. Option D is incorrect be-cause the frequency of data synchronization is generally not related to authentication issues with connected apps.

NEW QUESTION # 111
In troubleshooting Mutual SSL authentication issues on Tableau Server, what is a common area to investigate?

- A. The expiration dates of the SSL certificates on both the client and server
- B. The network bandwidth between the client and the Tableau Server
- C. The version of Tableau Server in relation to the SSL protocol version
- D. The compatibility of SSL certificates with different web browsers

Answer: A

Explanation:

The expiration dates of the SSL certificates on both the client and server A common issue in Mutual SSL authentication is the expiration of SSL certificates. Checking the expiration dates of the certificates on both the client and server sides is crucial, as expired certificates will prevent successful authentication. Regular monitoring and timely renewal of certificates are key to maintaining uninterrupted Mutual SSL connections. Option A is incorrect because while browser compatibility is important, it is not a common cause of Mutual SSL issues. Option C is incorrect as network bandwidth, while important for overall connectivity, does not directly impact Mutual SSL authentication. Option D is incorrect because the version of Tableau Server is generally not related to specific SSL protocol versions for Mutual SSL authentication.

NEW QUESTION # 112

In developing a custom view to monitor the performance of published data sources in Tableau Server, which part of the Tableau repository schema should be primarily analyzed?

- A. The 'data_connections' table to gain insights into connections and performance of published data sources
- B. The 'background_tasks' table to monitor the performance of scheduled tasks related to data sources
- C. The 'users' table to identify active users interacting with the data sources
- D. The 'server_usage' table to understand the overall server load and its impact on data source performance

Answer: A

Explanation:

The 'data_connections' table to gain insights into connections and performance of published data sources The 'data_connections' table in the Tableau repository schema is critical for tracking the performance of published data sources. It provides detailed information on each connection made to the data sources, offering insights into how these data sources are being accessed and utilized, which is crucial for understanding and optimizing their performance. Option A is incorrect because the 'users' table, while identifying users, does not provide specific information on data source performance. Option C is incorrect as the 'background_tasks' table focuses on scheduled tasks and does not offer detailed insights into real-time data source performance. Option D is incorrect because the 'server_usage' table provides a broad overview of server activity but does not offer the granular details required for monitoring specific data source performance.

NEW QUESTION # 113

A large financial institution requires a high level of security and performance for its Tableau Server deployment. How should service-to-node relationships be configured in this scenario?

- A. Isolating critical services like Data Server and Repository on separate nodes, while collocating less critical services
- B. Isolating all services on individual nodes to maximize security and performance
- C. Randomly distributing services across nodes without a specific strategy
- D. Collocating all services on a single node for simplicity and ease of management

Answer: A

Explanation:

Isolating critical services like Data Server and Repository on separate nodes, while collocating less critical services Isolating critical services enhances security and performance, especially for a financial institution, while collocating less critical services can optimize resource us-age and management. Option A is incorrect because isolating all services may lead to underutilization of resources and increased complexity. Option B is incorrect as collocating all services on a single node can create a single point of failure and performance bottlenecks. Option D is incorrect be-cause a strategic approach is necessary for efficient and secure service-to-node relationships.

NEW QUESTION # 114

......

TestSimulate is the website that has been known to learn IT technology. TestSimulate gets high praise from our customers in real test questions and answers. It is the real website that can help you to pass Salesforce Analytics-Arch-201 certificate. Why is TestSimulate very popular? Because TestSimulate has a group of IT elite which is committed to provide you with the best test questions and test answers. Therefore, TestSimulate will provide you with more and better certification training materials to satisfy your need.
