- A. Telemetry data is provided in a context that is relevant to the fabric intent.
- B. Digital sandbox provides notification of performance issues in the data center fabric.
- C. Data center fabric configuration is represented as the fabric intent in a declarative YAML format.

Answer: B

NEW QUESTION # 26
How are LLDP frames advertised between two Nokia SR Linux routers?

- A. They are forwarded to the destination node based on the MAC VRF table.
- B. They are periodically flooded to the broadcast MAC address on each interface.
- C. They are routed to the destination node based on the IP VRF forwarding table.
- D. They are forwarded to the destination node based on the MAC VRF table.

Answer: D

Explanation:
LLDP frames are periodically sent to a well-known multicast MAC address on each interface to discover directly connected devices.

NEW QUESTION # 27
Which of the following statements about resilient ECMP load balancing is TRUE?

- A. Hash buckets are used to ensure that flows egressing the same interface on one router use different egress interfaces on downstream routers.
- B. A different hash seed is used on downstream routers to ensure that flows are randomly distributed across all eligible router interfaces.
- C. The hash value used to distribute traffic is calculated as a modulo function on specific fields of the packet header.
- D. When one of the next-hops fail, only flows currently egressing to that next-hop are impacted.

Answer: D

Explanation:
In resilient ECMP load balancing, when a next-hop fails, only the flows that were using that specific next-hop are affected and need to be redistributed, minimizing disruption to other flows.
