## Data-Architect Practice Engine | Downloadable Data-Architect PDF

There are three versions of Data-Architect training materials for the candidate of you, and different versions have different advantages, you can use it in accordance with your own habit. Free update for each version for one year, namely, you don't need to buy the same version for many times, and the update version will send to you automatically. You will get the latest version of Data-Architect Training Materials.

Salesforce Data-Architect certification exam consists of 60 multiple-choice questions, which are accompanied by a case study. You will be asked to apply your knowledge of Salesforce data architecture concepts and implement best practices in the scenario presented in the case study. Data-Architect Exam is intended for professionals with advanced knowledge of data architecture concepts and experience designing complex Salesforce data models.

## Salesforce Certified Data Architect Sample Questions (Q24-Q29):

### NEW QUESTION # 24

NTO would like to retrieve their SF orgs meta data programmatically for backup within a various external. Which API is the best fit for accomplishing this task?

- A. Tooling API
- B. Bulk API in serial mode
- C. Metadata API
- D. SOAP API

**Answer: C**

Explanation:

The best API for retrieving Salesforce org metadata programmatically is the Metadata API. The Metadata API provides access to the metadata that defines the structure and configuration of an org, such as custom objects, fields, workflows, security settings, etc. It also supports deploying, retrieving, creating, updating, and deleting metadata components. The Metadata API can be used with various tools, such as Ant, Workbench, or IDEs.

#### **NEW QUESTION # 25**

Northern Trail Outfitters (NTO) has an external product master system that syncs product and pricing information with Salesforce. Users have been complaining that they are seeing discrepancies in product and pricing information displayed on the NTO website and Salesforce.

As a data architect, which action is recommended to avoid data sync issues?

- A. Build a custom integration for one-way sync of product and pricing information from product master to Salesforce.
- B. Implement a manual process to update the products from an extract from the products master on a weekly basis.
- C. Build a custom integration for two-way sync of product and pricing information between product master to Salesforce.
- **D. Use the Customer 360 data manager to sync product and pricing information from product master database to Salesforce.**

**Answer: D**

Explanation:

According to Trailhead2, Customer 360 Data Manager is a feature that allows administrators to connect, reconcile, and share customer data across Salesforce orgs and external systems. Customer 360 Data Manager can sync product and pricing information from product master database to Salesforce using predefined mappings and rules, ensuring data quality and consistency. Option D is the correct answer because it suggests using Customer 360 Data Manager to sync product and pricing information from product master database to Salesforce. Option A is incorrect because building a custom integration for two-way sync of product and pricing information between product master and Salesforce can introduce data conflicts and duplication issues, as both systems can update the same data independently. Option B is incorrect because building a custom integration for one-way sync of product and pricing information from product master to Salesforce can be costly and time-consuming, as it requires custom development and maintenance. Option C is incorrect because implementing a manual process to update the products from an extract from the products master on a weekly basis can result in data latency and errors, as the products information may change more frequently than once a week.

#### **NEW QUESTION # 26**

A large telecommunication provider that provides internet services to both residence and business has the following attributes:

A customer who purchases its services for their home will be created as an Account in Salesforce.

Individuals within the same house address will be created as Contact in Salesforce.

Businesses are created as Accounts in Salesforce.

Some of the customers have both services at their home and business.

What should a data architect recommend for a single view of these customers without creating multiple customer records?

- A. Customers are created as Accounts for Residence Account and use Parent Account to relate Business Account.
- B. Customer are created as individual objects and relate with Accounts for Business and Residence accounts.
- **C. Customers are created as Person Accounts and related to Business and Residential Accounts using the Account Contact relationship.**
- D. Customers are created as Contacts and related to Business and Residential Accounts using the Account Contact Relationships.

**Answer: C**

Explanation:

Creating customers as Contacts and relating them to Business and Residential Accounts using the Account Contact Relationships (option A) is the best option to recommend for a single view of these customers without creating multiple customer records, as it allows the data architect to model complex relationships between customers and accounts using native Salesforce features and tools. Creating customers as Person Accounts and relating them to Business and Residential Accounts using the Account Contact relationship (option B) is not a good option, as it may create data redundancy and inconsistency, and it does not leverage the existing Contact object. Creating customers as individual objects and relating them with Accounts for Business and Residence accounts (option C) is also not a good option, as it may require more customization and maintenance effort, and it does not leverage the

existing Account and Contact objects. Creating customers as Accounts for Residence Account and using Parent Account to relate Business Account (option D) is also not a good option, as it may create confusion and complexity with the account hierarchy, and it does not leverage the existing Contact object.

#### NEW QUESTION # 27

Universal Containers (UC) is migrating from a legacy system to Salesforce CRM, UC is concerned about the quality of data being entered by users and through external integrations.

Which two solution should a data architect recommend to mitigate data quality issues?

- A. Leverage Apex to validate the format of data being entered via a mobile device.
- B. Leverage validation rules and workflows.
- C. Leverage picklist and lookup fields where possible
- D. Leverage third-party- AppExchange tools

**Answer: B,C**

#### NEW QUESTION # 28

North Trail Outfitters (NTD) is in the process of evaluating big objects to store large amounts of asset data from an external system. NTO will need to report on this asset data weekly.

Which two native tools should a data architect recommend to achieve this reporting requirement?

- A. Async SOQL with a custom object
- B. Einstein Analytics
- C. Standard reports and dashboards
- D. Standard SOQL queries

**Answer: A,B**

Explanation:

Async SOQL with a custom object (option B) and Einstein Analytics (option D) are the two native tools that can be used to report on big object data. Async SOQL allows querying big object data and storing the results in a custom object, which can then be used for reporting. Einstein Analytics can connect to big object data sources and provide advanced analytics and visualization features. Standard reports and dashboards (option A) and standard SOQL queries (option C) cannot be used to report on big object data, as they do not support big object fields
