Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q34-Q39):

NEW QUESTION # 34

Which role does the local network gateway play in FortiGate to Azure VPN connectivity?

- A. It manages the encryption keys for the VPN connection
- B. It is responsible for load balancing traffic between FortiGate and Azure
- C. It defines the IP addresses of the on-premises network
- D. It represents the Azure VPN Gateway in the FortiGate configuration

Answer: C

Explanation:

The local network gateway in Azure represents the on-premises VPN device (such as FortiGate) and defines the on-premises public IP address and the address prefixes of the on-premises network. This is essential for configuring site-to-site VPN connections from Azure to FortiGate.

NEW QUESTION # 35

What is a limitation of the Network Security Groups (NSGs) in Azure?

- A. NSGs cannot be applied to individual virtual machines.
- B. NSGs are applied only to vNICs.
- C. NSGs operate at the application layer, limiting their effectiveness in the network layer.
- D. NSGs allow the filtering of inbound traffic only.

Answer: B

Explanation:

A limitation of NSGs is that they are applied only at the subnet level or to network interfaces (vNICs), not directly to other resources like load balancers or application gateways. This means granular application-layer filtering is not supported, and NSGs primarily operate at Layers 3 and 4.

NEW QUESTION # 36

What is a requirement when you deploy a FortiGate active-active cluster in Azure?

- A. You must use unicast FGCP to synchronize the configurations.
- B. You must assign the public IP address to an Azure load balancer.
- C. You must configure all FortiGate VMs with three or more interfaces.
- D. You must configure both load balancers to allow administrative access.

Answer: B

Explanation:

In an active-active FortiGate cluster deployment in Azure, you must assign the public IP address to an Azure load balancer. This is required because Azure does not support multiple VMs sharing a single public IP directly. The Azure Load Balancer handles inbound traffic and distributes it to the active FortiGate instances.

NEW QUESTION # 37

Why would you use a user-defined route in Azure?

- A. To manage user authentication and access control
- B. To allow inbound management access to FortiGate VMs
- C. To have the traffic from the other VMs inspected by FortiGate
- D. To allow communication between FortiGate VMs on two subnets in the same VNET

Answer: C

Explanation:

User-defined route (UDR) in Azure is used to redirect traffic from other VMs through a FortiGate VM for inspection. By modifying the routing table, you ensure that outbound or inter-subnet traffic is sent to the FortiGate as the next hop, enabling traffic filtering, logging, and security enforcement.

NEW QUESTION # 38

How does Azure ExpressRoute contribute to achieving predictable latency for network traffic?

- A. By prioritizing Azure ExpressRoute traffic over other network traffic
- **B. By establishing dedicated private connections to Azure data centers**
- C. By relying on load balancing to dynamically optimize latency
- D. By using public internet connections for enhanced routing flexibility

Answer: B

Explanation:

Azure ExpressRoute provides dedicated private connections between on-premises infrastructure and Azure data centers, bypassing the public internet. This results in more predictable latency, higher reliability, and better security, making it ideal for mission-critical workloads.
