NEW QUESTION # 70

A company is looking to expand its compute environment and requires full-performance enterprise servers but wants to avoid over-provisioning resources and optimize cost-effectiveness.

Which PowerEdge server portfolio alignment provides feature-optimized technology and full-performance enterprise capabilities for scaling compute environments efficiently?

- A. Deploy specialized modules for optimized compute
- B. A Recommend GPU-Optimized Servers for cost efficiency
- C. Utilize Edge-optimized servers for enterprise scaling
- D. Suggest mainstream optimized PowerEdge servers for balanced scaling

Answer: D

NEW QUESTION # 71

What is commonly by a system administrator to prevent electrostatic discharge when working inside a Dell EMC PowerEdge server?

- A. Uninterruptible Power Supply
- B. Voltage Regular

- D. Non anti-static floor mat

Answer: C

NEW QUESTION # 72

Power supply unit 2 (PSU 2) on a Dell PowerEdge R760 server has been losing power several times a day.

The system administrator is planning to replace the power supply but is unsure which power supply is referenced as PSU 2. What is the most reliable way for the system administrator to visually identify PSU 2?

- A. Look for a constant amber LED on PSU 1, indicating a problem with that unit
- B. Assume PSU 2's LEDs are off because the iDRAC has disabled it
- C. Use the iDRAC web UI to activate the blink option for PSU 2's LED
- D. Check the chassis label near the power supplies for PSU numbers

Answer: D

Explanation:

The most reliable way to identify PSU 2 on a PowerEdge R760 is to check the chassis label near the power supplies, which clearly marks PSU numbers for accurate identification. This physical label ensures certainty without assumptions. Using iDRAC to blink LEDs is useful but less direct, assuming LEDs are off is unreliable, and checking PSU 1's LED does not identify PSU 2.
