Exam SPLK-2003 Collection - SPLK-2003 Latest Study Materials

Investing in a Splunk Phantom Certified Admin (SPLK-2003) certification is essential for professionals looking to advance their careers and stay competitive in the job market. With our actual Splunk SPLK-2003 questions PDF, SPLK-2003 practice exams along with the support of our customer support team, you can be confident that you are getting the best possible SPLK-2003 Preparation material for the test. Download Real SPLK-2003 questions today and start your journey to success.

The Splunk SPLK-2003 Exam covers a range of topics, including configuring and managing Splunk Phantom, creating and managing playbooks, using automation to improve security operations, and integrating Splunk Phantom with other security tools. Candidates

who pass the exam will have demonstrated their ability to effectively manage and administer Splunk Phantom, and will have the skills and knowledge needed to improve security operations through automation and orchestration.

Splunk Phantom Certified Admin Sample Questions (Q17-Q22):

NEW QUESTION # 17

Which app allows a user to send Splunk Enterprise Security notable events to Phantom?

- **A. Any of the integrated Splunk/Phantom Apps**
- B. Splunk App for Phantom Reporting.
- C. Splunk App for Phantom.
- D. Phantom App for Splunk.

Answer: A

NEW QUESTION # 18

Which two playbook blocks can discern which path in the playbook to take next?

- **A. Prompt and decision blocks.**
- B. Filter and decision blocks.
- C. Filter and prompt blocks.
- D. Decision and action blocks.

Answer: A

Explanation:

<https://docs.splunk.com/Documentation/SOAR/current/Playbook/DecisionBlock> In Splunk SOAR playbooks, the blocks that can discern which path to take next are the prompt and decision blocks. The prompt block allows the playbook to pause and wait for user input, which can then determine the subsequent path of execution based on the response provided. The decision block evaluates conditions based on data within the playbook and directs the flow to different paths accordingly¹.

The decision block is used to change the flow of artifacts by performing IF, ELSE IF, or ELSE functions.

When an artifact meets a True condition, it is passed downstream to the corresponding block in the playbook flow¹. The prompt block, on the other hand, interacts with users to make decisions during playbook execution, which can also influence the direction of the playbook's flow.

References:

Splunk SOAR documentation on using decisions to send artifacts to a specific downstream action in your playbook

NEW QUESTION # 19

A customer wants to design a modular and reusable set of playbooks that all communicate with each other.

Which of the following is a best practice for data sharing across playbooks?

- A. Call the child playbooks getter function.
- **B. Create artifacts using one playbook and collect those artifacts in another playbook.**
- C. Use the Handle method to pass data directly between playbooks.
- D. Use the py-postgresql module to directly save the data in the Postgres database.

Answer: B

Explanation:

The correct answer is C because creating artifacts using one playbook and collecting those artifacts in another playbook is a best practice for data sharing across playbooks. Artifacts are data objects that are associated with a container and can be used to store information such as IP addresses, URLs, file hashes, etc. Artifacts can be created using the add artifact action in any playbook block and can be collected using the get artifacts action in the filter block. Artifacts can also be used to trigger active playbooks based on their label or type. See Splunk SOAR Documentation for more details.

In the context of Splunk SOAR, one of the best practices for data sharing across playbooks is to create artifacts in one playbook and use another playbook to collect and utilize those artifacts. Artifacts in Splunk SOAR are structured data related to security incidents (containers) that playbooks can act upon. By creating artifacts in one playbook, you can effectively pass data and context to subsequent playbooks, allowing for modular, reusable, and interconnected playbook designs. This approach promotes efficiency, reduces redundancy, and enhances the playbook's ability to handle complex workflows.

NEW QUESTION # 20

Severity can be set during ingestion and later changed manually. What other mechanism can change the severity of a container?

- A. Notes
- B. Actions
- C. Service level agreement (SLA) expiration
- D. Playbooks

Answer: D

Explanation:

Explanation

Playbooks can change the severity of a container by using the set severity action block. This block allows the user to specify a new severity level for the container or use a variable from a previous action result. Notes and actions do not affect the severity of a container, and SLA expiration only affects the status of the container, not the severity. Reference, page 10.

NEW QUESTION # 21

On the Splunk search head, when configuring the app to search SOAR searchable content, what are the two requirements to complete the app setup?

- A. User accounts and REST API.
- B. User accounts and an HTTP Event Collector token.
- C. User accounts and universal forwarder.
- D. User accounts and syslog.

Answer: A

NEW QUESTION # 22
