Citrix 1Y0-204 Exam is a rigorous exam that requires a significant amount of preparation and study. It is recommended that candidates have prior experience working with Citrix Virtual Apps and Desktops 7, as well as a solid understanding of networking, storage, and virtualization concepts. 1Y0-204 exam consists of multiple-choice questions and simulations that require the candidate to demonstrate their knowledge and skills in managing Citrix Virtual Apps and Desktops 7 environments.

To prepare for the Citrix 1Y0-204 exam, candidates can take advantage of a variety of study resources, including online training courses, study guides, and practice exams. Citrix also offers a certification program for IT professionals who want to demonstrate

their knowledge and skills in the administration and management of Citrix Virtual Apps and Desktops 7. Citrix Virtual Apps and Desktops 7 Administration certification program includes several levels, including the Citrix Certified Associate – Virtualization (CCA-V) and the Citrix Certified Professional – Virtualization (CCP-V).

Citrix Virtual Apps and Desktops 7 Administration Sample Questions (Q196-Q201):

NEW QUESTION # 196
Scenario: A Citrix Administrator of a large, multi-domain company needs to configure specific Group Policy Object (GPO) settings for Citrix Workspace app (Receiver) on managed endpoints that are in various locations. The administrator needs to have the ability to save the GPO template file to the Active Directory central store, so that Group Policy Administrators located in other domains can utilize it.
Which step should the administrator take to accomplish this task?

- A. Use the available Receiver ADMX and ADML template to configure the required settings locally.
- B. Use the available Receiver ADML template to configure the required settings locally.
- C. Use the available Receiver ADML template to configure the required settings at the domain level.
- D. Use the available Receiver ADMX and ADML template to configure the required settings at the domain level.

Answer: C

NEW QUESTION # 197
Scenario: A user is working on a document in an HDX session and saves data on the desktop. The Virtual Delivery Agent (VDA) session abruptly crashes, causing the saved data to be lost.
Which Citrix Profile Management policy can a Citrix Administrator enable to prevent data loss?

- A. Active Write Back
- B. Profile Caching
- C. Delay Cached Profile Deletion
- D. Profile Streaming

Answer: D

NEW QUESTION # 198
Scenario: A Citrix Administrator is concerned about the amount of health checks the Citrix ADC is sending to the backend resources. The administrator would like to find a way to remove health checks from specific bound services.
How can the administrator accomplish this?

- A. Use Service Groups to minimize health checks.
- B. Use reverse condition monitoring.
- C. Use the No-Monitor option.
- D. Unbind the current monitor.

Answer: C

Explanation:
Explanation
According to the Citrix documentation1, the No-Monitor option allows the administrator to remove health checks from specific bound services. This option is useful when the administrator wants to reduce the number of health checks sent to the backend resources, or when the administrator knows that a particular service is always up and does not need to be monitored.

NEW QUESTION # 199
Scenario: A Citrix Administrator has received complaints from published application users. They report that it takes a long time to relaunch an application after they close it by mistake.
The administrator needs a solution that will reduce application launch times in these situations.
Which feature should the administrator enable?

- A. Application Prelaunch
- B. Session Sharing
- C. Session Reliability
- D. Application Lingering

Answer: A

NEW QUESTION # 200
Scenario: A Citrix Administrator needs to configure persistence on a Global Server Load Balancing (GSLB) virtual server to which a service is bound, so that the service continues to serve requests from the client event after it is disabled manually, accepting new requests or connections only to honor persistence. After a configured period of time, no new requests or connections are directed to the service and all of the existing connections are closed.
Which parameter can the administrator configure while disabling the service to achieve this requirement?

- A. Persistence Time-Out
- B. Request Threshold
- C. Persistence Threshold
- D. Wait Time

Answer: A

Explanation:
Explanation
According to the Citrix documentation1, persistence time-out is the parameter that determines how long the service continues to serve requests from the client after it is disabled manually. The service accepts new requests or connections only to honor persistence. After the persistence time-out expires, no new requests or connections are directed to the service and all of the existing connections are closed. This parameter is available only when the service is disabled gracefully. The default value is 2 minutes. The other options are not related to the scenario described in the question.
