CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions (Q76-Q81):

NEW QUESTION # 76

When defining Falcon Cloud Security Rules, which of the following is a key factor for ensuring that rules are effective and minimally

disruptive?

- **A. Conduct regular testing of rules in an audit-only mode before enforcing them.**
- B. Use generic, broad rule conditions to apply policies universally across all workloads.
- C. Assign rules based on specific regions where cloud workloads are hosted.
- D. Configure rules to override all existing cloud provider security configurations.

Answer: A

Explanation:

Option A: Testing rules in an audit-only mode allows administrators to evaluate their impact on workloads and cloud resources without disrupting operations. This approach ensures that the rules are correctly scoped and that they do not generate false positives or block legitimate activities before they are enforced.

Option B: Falcon Cloud Security Rules are designed to complement, not override, cloud provider security configurations. Overriding could lead to conflicts or weakened security postures.

Option C: While considering regions might be relevant in some scenarios, effective rules focus on workloads and actions rather than just geographic regions.

Option D: Broad rules can lead to unintended consequences, such as blocking legitimate activities or overwhelming administrators with alerts. Granular and specific rules are critical for effective policy enforcement.

NEW QUESTION # 77

Which of the following steps is required to successfully integrate the Falcon CWPP Image Scanning Script with a CI/CD pipeline for image assessment?

- A. Install the Falcon CWPP agent on all developer machines.
- B. Modify the pipeline script to execute the Image Scanning Script during the post-deployment phase.
- C. Schedule the script to run daily on the production environment's container images.
- **D. Use the Falcon API to fetch a unique API token and store it in the pipeline configuration file.**

Answer: D

Explanation:

Option A: Image scanning should occur before deployment to identify vulnerabilities early in the development lifecycle. Running the script post-deployment defeats the purpose of proactive security measures.

Option B: While the Falcon CWPP agent is part of the larger CrowdStrike solution, it is not required for the Image Scanning Script's integration into a CI/CD pipeline. The scanning process is executed during pipeline stages and doesn't depend on agents on developer machines.

Option C: Image assessments should be part of the CI/CD pipeline to detect vulnerabilities during development. Running scans on production images introduces unnecessary risk and is not the intended use case of the Image Scanning Script.

Option D: To authenticate the Image Scanning Script with the Falcon platform, a unique API token is required. This token allows secure communication between the CI/CD pipeline and the Falcon API, enabling image assessments to occur seamlessly. Failure to include this step results in authentication issues, causing the script to fail.

NEW QUESTION # 78

Which of the following best describes the primary function of CrowdStrike's Cloud Infrastructure Entitlement Manager (CIEM)/Identity Analyzer?

- A. Encrypting data stored in cloud object storage services.
- **B. Detecting excessive permissions and minimizing cloud identity risks.**
- C. Monitoring network traffic for signs of unauthorized access.
- D. Providing endpoint protection for virtual machines in the cloud.

Answer: B

Explanation:

Option A: Encryption is a data protection task handled by tools such as AWS KMS or Azure Key Vault, not CIEM. Misinterpreting CIEM as a data encryption tool is a common misconception.

Option B: Endpoint protection is handled by solutions like CrowdStrike Falcon, not CIEM. CIEM focuses exclusively on identity and access management.

Option C: While important for cloud security, this is primarily the role of cloud network monitoring tools or firewalls, not CIEM, which focuses on identity and permissions.

Option D: CIEM/Identity Analyzer specializes in identifying excessive, unused, or misconfigured permissions across cloud environments, helping organizations enforce the principle of least privilege. This is critical for reducing the risk of insider threats and accidental exposures. Many users confuse this functionality with broader cloud security tools, but CIEM's focus is on identity and access governance.

NEW QUESTION # 79

During a routine audit, you discover that multiple endpoints in your CrowdStrike Falcon inventory are missing critical metadata, such as hostname and operating system details. What is the most effective way to resolve this issue and maintain an accurate asset inventory?

- **A. Deploy the Falcon sensor on the affected endpoints to collect detailed telemetry.**
- B. Remove the endpoints from the inventory to prevent confusion.
- C. Ignore the issue, as the devices will update themselves automatically over time.
- D. Reassign the endpoints to a different group within the platform.

Answer: A

Explanation:

Option A: The Falcon sensor provides detailed telemetry, including metadata such as hostname, operating system, and other critical details. Deploying the sensor ensures the inventory is accurate and up-to-date, enabling effective monitoring and management.

Option B: Removing endpoints creates blind spots in the inventory and security monitoring.

Properly identifying and managing them is critical for maintaining security posture.

Option C: Relying on automatic updates without addressing the root cause may leave critical gaps in asset visibility and management. Proactive action is necessary.

Option D: Reassigning the endpoints does not resolve the underlying issue of missing metadata.

The problem requires deploying the sensor to collect accurate data.

NEW QUESTION # 80

How does CrowdStrike's Application Security Posture Management (ASPM) enhance container security?

- A. By enforcing MFA on cloud users
- B. By deploying agentless runtime protection
- C. By scanning deployed pods
- **D. By identifying and fixing insecure configurations in code before deployment**

Answer: D
