Candidates can reach out to the Exam-Killer support staff anytime. The Exam-Killer help desk is the place to go if you have any questions or problems. Time management is crucial to passing the Confluent CCDAK exam. Candidates may prepare for the Confluent CCDAK Exam with the help of Exam-Killer desktop-based CCDAK practice exam software, web-based CCDAK practice tests and Confluent CCDAK pdf questions.

Confluent Certified Developer for Apache Kafka (CCDAK) Certification Exam is a comprehensive certification program that validates the skills and expertise of developers who work with Apache Kafka. CCDAK Exam is designed to test the knowledge and abilities of developers in designing, developing, and deploying Kafka-based applications. Confluent Certified Developer for Apache Kafka Certification Examination certification program is offered by Confluent, the company behind Apache Kafka, and is recognized globally as a mark of excellence in Kafka development.

## Confluent CCDAK Test Passing Score, CCDAK Valid Exam Prep

Our clients come from all around the world and our company sends the products to them quickly. The clients only need to choose the version of the product, fill in the correct mails and pay for our CCDAK study materials. Then they will receive our mails in 5-10 minutes. Once the clients click on the links they can use our CCDAK Study Materials immediately. If the clients can't receive the

mails they can contact our online customer service and they will help them solve the problem. Finally the clients will receive the mails successfully. The purchase procedures are simple and the delivery of our CCDAK study materials is fast.

The CCDAK exam is a hands-on assessment that tests the candidate's ability to design, develop, and deploy Kafka-based applications using different programming languages, such as Java, Scala, and Python. CCDAK exam covers a wide range of topics, including Kafka architecture, data serialization and deserialization, producer and consumer APIs, stream processing, and Kafka Connect. CCDAK Exam also evaluates the candidate's ability to troubleshoot common Kafka issues and optimize Kafka performance.

## Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q58-Q63):

### NEW QUESTION # 58

How will you set the retention for the topic named my-topic to 1 hour?

- A. Set the broker config `log.retention.ms` to 3600000
- B. Set the consumer config `retention.ms` to 3600000
- C. Set the producer config `retention.ms` to 3600000
- **D. Set the topic config `retention.ms` to 3600000**

**Answer: D**

Explanation:

`retention.ms` can be configured at topic level while creating topic or by altering topic. It shouldn't be set at the broker level (`log.retention.ms`) as this would impact all the topics in the cluster, not just the one we are interested in

### NEW QUESTION # 59

A stream processing application is consuming from a topic with five partitions. You run three instances of the application. Each instance has `num.stream.threads=5`.

You need to identify the number of stream tasks that will be created and how many will actively consume messages from the input topic.

- A. 5 created, 5 actively consuming
- B. 15 created, 5 actively consuming
- **C. 15 created, 15 actively consuming**
- D. 5 created, 1 actively consuming

**Answer: C**

Explanation:

In Kafka Streams, the number of stream tasks = number of input partitions × num.stream.threads × number of instances, but only as many as the number of partitions can actively consume at once.

However, in this case, Kafka Streams assigns one task per partition, and because there are 5 partitions and 15 threads (3 instances × 5 threads), 15 tasks are created, and all 15 can be active depending on processing topology.

From Kafka Streams Developer Guide:

"Kafka Streams creates one task per input partition. If you increase the number of stream threads, it runs multiple tasks in parallel within a single instance." So, 15 stream tasks will be created and 15 will be actively consuming.

Reference: Apache Kafka Streams Documentation > Concepts > Tasks and Threads

### NEW QUESTION # 60

Which two statements about Kafka Connect Single Message Transforms (SMTs) are correct?

(Select two.)

- A. SMT functionality is included within Kafka Connect converters.
- **B. Multiple SMTs can be chained together and act on source or sink messages.**
- C. SMTs are often used to join multiple records from a source data system into a single Kafka record.
- **D. Masking data is a good example of an SMT.**

**Answer: B,D**

Explanation:

SMTs (Single Message Transforms) are lightweight transformations applied to individual messages as they pass through Kafka Connect.

Chaining SMTs: You can apply multiple SMTs in sequence by defining them in order in the connector config.

Masking or modifying fields is a common use case (e.g., redacting sensitive data).

From Kafka Connect Documentation:

"Single Message Transforms (SMTs) are applied to individual messages. You can chain multiple SMTs together." SMTs do not perform joins (B is incorrect).

Converters and SMTs are separate concerns (D is incorrect).

Reference: Kafka Connect Transformations Guide

### NEW QUESTION # 61

(You are developing a Java application that includes a Kafka consumer.

You need to integrate Kafka client logs with your own application logs.

Your application is using the Log4j2 logging framework.

Which Java library dependency must you include in your project?)

- A. None, the correct dependency will be added transitively by the Kafka client
- **B. SLF4J implementation for Log4j2 (org.apache.logging.log4j:log4j-slf4j-impl)**
- C. SLF4J implementation for Log4j 1.2 (org.slf4j:slf4j-log4j12)
- D. Just the Log4j2 dependency of the application

**Answer: B**

Explanation:

According to the official Apache Kafka client documentation, Kafka uses SLF4J (Simple Logging Facade for Java) for all client-side logging. SLF4J is only an abstraction layer and requires a concrete logging implementation to route log messages to the actual logging framework used by the application.

Since the application uses Log4j2, an SLF4J-to-Log4j2 binding must be provided. The correct and officially recommended dependency is org.apache.logging.log4j:log4j-slf4j-impl. This dependency acts as the SLF4J implementation and forwards all Kafka client log messages to Log4j2, ensuring consistent logging across the application.

Option B is incorrect because it targets the legacy Log4j 1.2 framework, which is deprecated and incompatible with Log4j2. Option C is insufficient because Log4j2 alone does not satisfy Kafka's SLF4J dependency. Option D is incorrect because Kafka intentionally does not include a logging implementation transitively, allowing applications to choose their preferred logging framework. Therefore, including the SLF4J implementation for Log4j2 is required to properly integrate Kafka client logs.

### NEW QUESTION # 62

How do you create a topic named test with 3 partitions and 3 replicas using the Kafka CLI?

- A. bin/kafka-topics-create.sh --zookeeper localhost:9092 --replication-factor 3 --partitions 3 --topic test
- B. bin/kafka-topics.sh --create --bootstrap-server localhost:2181 --replication-factor 3 --partitions 3 --topic test
- C. bin/kafka-topics.sh --create --broker-list localhost:9092 --replication-factor 3 --partitions 3 --topic test
- **D. bin/kafka-topics.sh --create --bootstrap-server localhost:9092 --replication-factor 3 --partitions 3 --topic test**

**Answer: D**

Explanation:

As of Kafka 2.3, the kafka-topics.sh command can take --bootstrap-server localhost:9092 as an argument.

You could also use the (now deprecated) option of --zookeeper localhost:2181.
