Appian Senior Developer Sample Questions (Q92-Q97):

NEW QUESTION # 92

A recent Health Check report of your application indicates an increased risk of large context size in the interfaces. What are two possible contributors to this risk? (Choose two.)

- A. The load variable has a web service response as JSON.
- **B. Multiple local variables hold duplicate data.**
- **C. Data transformation is performed inside the interface rather than delegated to the source system.**
- D. Local variables are set to refresh every five minutes.

Answer: B,C

Explanation:

Performing data transformation inside the interface can increase the amount and size of context data stored, raising context size risk. Multiple local variables holding duplicate data unnecessarily inflate the interface's memory footprint, contributing to large context size.

NEW QUESTION # 93

Consider this POST request:

<https://www.example.com/suite/webapi/customer>

```
[{
  id: "7",
  name: "John Smith",
  DOB: "1980-02-12",
  firstPurchaseDate: "2022-03-12"
}]
```

Match the values to the correct fields in the resulting http:request value.

Note: Each value will be used once. To change your responses, you may deselect your response by clicking the blank space at the top of the selection list.

Body*Select a match:*

```
https://www.example.com/suite/webapi/customer/  
{  
(Content-Type: "application/json")  
"id=7&name=John+Smith&DOB=1980-02-12&firstPurchaseDate=2016-03-12"  
(id:"7",name:"John Smith",DOB:"1980-02-12",firstPurchaseDate:"2023-03-12")
```

formData*Select a match:*

```

NEW QUESTION # 94

You're the administrator of your insurance company's case management system. You need to limit insurance agents to only those clients to which they have been assigned.

Which two statements must be true for one way to configure Record-Level security for the Customer record? (Choose two.)

- A. Data sync should be enabled.
- B. A condition should be added to the record-level security rule to specify which cases specifically named agents can access.
- C. A new record-level security rule should be created using the Users found in fields option to specify that if a user is found in the "assignedAgent" field (which is a type User), then they can see their cases.
- D. Record-level security means agents must have permission to view the record type and permission to edit the records.

Answer: B,C

Explanation:

Creating a record-level security rule using the "Users found in fields" option ensures agents only see records assigned to them through the "assignedAgent" field.

Adding a condition to the rule further refines which records (cases) each agent can access, implementing precise record-level security.

NEW QUESTION # 95

You're making a POST request to the Appian web API. You need to include complex data structures, such as lists or objects, in the request body.

How should you design the API to accept those requests?

- A. Use query parameters to represent the complex data structures.
- B. Convert the complex data structures to JSON and include them in the request body as a string.
- C. Use XML format to represent the complex data structures in the request body.

Answer: B

Explanation:

To include complex data structures like lists or objects in a POST request to an Appian Web API, you should convert the data to JSON and include it in the request body as a string. Appian supports application/json content type for parsing complex data structures in APIs.

NEW QUESTION # 96

You're performing System Integration Testing on a client's application that integrates with an external system.

In this instance, you're testing the application's interactions with external integrations to ensure that data is being handled correctly between the two systems. However, this step has been done manually and is time-consuming.

What should you do to make this process more efficient?

- A. Utilize Appian-Locust to develop and execute performance tests on the systems integrations by scripting a scenario where multiple users are interacting with the external systems simultaneously.
- B. Utilize FitNesse for Appian to perform automated functional testing on the workflows that include integrated systems through a defined set of test cases.
- C. Utilize the Postman API Platform to test the integrations with the external system and Appian's web APIs through a defined set of test cases.

Answer: B

Explanation:

FitNesse for Appian is designed for automated functional testing of Appian workflows, including those that call external integrations. By building repeatable FitNesse test scripts that drive the end-to-end process, you can automatically verify that data is correctly sent

to - and returned from - the external system each time, greatly reducing the manual effort of system-integration testing.

NEW QUESTION # 97
