

# 최근 인기시험 PMHNP 최고 품질 덤프데모 다운로드 덤프

- A. Generic Webservice Provider
- B. Connector Studio
- C. Server API integrations
- D. Web client application

정답: B, C

질문 # 27

여러분은 우선 우리 PassTIP사이트에서 제공하는 SAP인증 C\_C4H630\_21시험덤프의 일부 문제와 답을 체험해보세요. 우리 PassTIP를 선택해주신다면 우리는 최선을 다하여 여러분이 꼭 한번에 시험을 패스할 수 있도록 도와드리겠습니다. 만약 여러분이 우리의 인증시험덤프를 보시고 시험에 왕성하게 패스를 하지 못하였다면 우리는 무조건 덤프비용전부를 환불해드립니다.

**C\_C4H630\_21** 링크: [https://www.pasttip.net/C\\_C4H630\\_21-pass-exam.html](https://www.pasttip.net/C_C4H630_21-pass-exam.html)

PassTIP의 SAP인증 C\_C4H630\_21덤프의 인지도는 아주 높습니다. PassTIP의 SAP인증 C\_C4H630\_21 덤프는 시험패스율이 거의 100%에 달하여 많은 사랑을 받아왔습니다. SAP C\_C4H630\_21 시험을 가장 쉽게 합격하는 방법이 PassTIP의 SAP C\_C4H630\_21 덤프를 마스터하는 것입니다. SAP C\_C4H630\_21 시험덤프로 성공으로 향하는 길에는 많은 방법과 방식이 있습니다. 우리 PassTIP에서는 최고의 최신의 SAP인증 C\_C4H630\_21 덤프자료를 제공함으로 여러분을 도와 SAP인증 C\_C4H630\_21 인증자격증을 쉽게 취득할 수 있게 해드립니다. 만약 아직도 SAP인증 C\_C4H630\_21 시험패스를 위하여 고군분투하고 있다면 바로 우리 PassTIP를 선택함으로 여러분의 고민을 날려버릴수 있습니다. SAP C\_C4H630\_21 덤프를 한번 믿고 SAP C\_C4H630\_21 시험에 뚜렷이 우승하세요.

우리는 손사래를 치며 어색하게 웃었다. 유미까지 부추겼지만 우리는 고개를 저었다. PassTIP의 SAP인증 C\_C4H630\_21 덤프의 인지도는 아주 높습니다. PassTIP의 SAP인증 C\_C4H630\_21 덤프는 시험패스율이 거의 100%에 달하여 많은 사랑을 받아왔습니다.

## Q1267):

### 질문 # 1262

The psychiatric mental health nurse practitioner is often involved in the psychoeducation of patients and families. The PMHNP must know that with both child and adult education, there are three major determinants of learning. These three elements do not include:

- A. learner needs
- B. preferred learning style
- C. readiness to learn
- D. **instructor needs**

정답: D

### 설명:

The psychiatric mental health nurse practitioner (PMHNP) plays a crucial role in the psychoeducation of patients and their families, necessitating a deep understanding of the factors that facilitate effective learning. When educating both children and adults, it is essential to consider the primary determinants of learning, which significantly impact the educational outcomes. The question at hand emphasizes understanding which elements are not determinants of learning in this context.

Determinants of learning are critical factors that influence the effectiveness and efficiency with which a person acquires and retains information. For a PMHNP involved in educating patients and families, it is vital to focus on these determinants to tailor education sessions that meet the specific needs and capabilities of the learners. The three primary determinants of learning include the learners' needs, their readiness to learn, and their preferred learning style. Each of these factors plays a distinct role: 1. **\*\*Learner Needs\*\***: Understanding what the learners need to know is foundational. This involves assessing the knowledge gaps and determining the specific information that is most pertinent to the learners at that point in their care or treatment. 2. **\*\*Readiness to Learn\*\***: This refers to the learners' psychological, physical, and emotional state that affects their ability to engage with and absorb new information. Factors such as stress, health status, and mental state can significantly influence readiness. 3. **\*\*Preferred Learning Style\*\***: Individuals have unique ways in which they best receive and process information, such as visual, auditory, or kinesthetic learning styles. Tailoring the education to fit these styles can enhance understanding and retention.

Conversely, "instructor needs" do not constitute a determinant of learning in this context. While the needs of the instructor, such as their objectives, comfort, and resources, might influence the delivery of education, they are not considered a primary factor influencing the learner's capacity and effectiveness in learning. The focus should always remain on the learner's requirements, readiness, and preferences.

In practice, assessing these determinants begins with understanding the audience, selecting an appropriate setting, and gathering relevant data about and from the learners. Involvement of the healthcare team can also provide a broader perspective and help in prioritizing the educational needs based on medical and psychological factors. By aligning educational strategies with these determinants, PMHNPs can significantly enhance the impact of their psychoeducational interventions.

### 질문 # 1263

A PMHNP is working with a patient who has a history of medication non-compliance. The patient's family requests a long-acting injectable medication without the patient's knowledge to ensure compliance. Which ethical principle should primarily guide the PMHNP's response?

- A. Veracity
- B. Beneficence
- C. **Autonomy**
- D. Fidelity

정답: C

### 설명:

Autonomy emphasizes respecting the patient's right to make informed decisions about their treatment, including the right to accept or refuse medications.

Beneficence, while important, does not override the patient's right to make informed decisions about their care unless there is a clear risk of self-harm. Fidelity, the principle of loyalty and faithfulness to the patient, supports maintaining trust but is not as directly related to the issue of informed consent. Veracity, the principle of truthfulness, is also an important consideration but secondary to the patient's autonomy in this scenario.

### 질문 # 1264

A patient has suffered a stroke in Broca's area of the brain and is experiencing difficulty communicating. Which of the following interventions would best promote the optimization of the patient's long-term functionality?

- A. Administer cognitive-enhancing medication
- B. Prescribe an antidepressant medication
- C. Offer a communication board for the patient to use
- D. Refer the patient to a speech therapist

정답: D

설명:

Broca's area, located in the frontal lobe, is responsible for language production and speech. A stroke in this area can result in a condition known as Broca's aphasia, characterized by difficulty with speech production, grammar, and word finding. Speech therapy is the primary intervention for patients with Broca's aphasia, as it can help the patient regain their ability to communicate.

Antidepressant and cognitive-enhancing medication may help with mood and cognitive function but would not address the language production issue. A communication board may be helpful for the patient, but it would not address the underlying problem. A speech therapist would be the best option.

#### 질문 # 1265

Drug efficacy and safety are important parts of prescribing rights for nurse practitioners. Which superfamily of enzymes and their isoenzymes is mainly responsible for the metabolism of xenobiotics and drugs and can be assessed through genetic testing?

- A. Gamma-glutamyltranspeptidase
- B. Alkaline phosphatase
- C. Cytochrome P450
- D. Aspartate aminotransferase

정답: C

설명:

Studying the body's response to medication is an important part of prescribing. One enzyme in a subfamily of this superfamily of enzymes, in particular, is responsible for processing many antidepressants and antipsychotic medications.

CYP450 tests can now be ordered to determine how a patient's body processes a particular medication. There are at least 25 FDA-approved medication labels that contain pharmacogenetic information related to CYP450 enzymes. CYP2D6 is an enzyme in the CYP450 superfamily, which processes many antipsychotic and antidepressant medications.

#### 질문 # 1266

Which of the following would more than likely be included in treatment of the patient with depression?

- A. All of the above
- B. Individual therapy
- C. Cognitive therapy
- D. Psychopharmacology

정답: A

설명:

The treatment of depression is multifaceted and typically involves a combination of therapeutic approaches tailored to meet the individual needs of the patient. The correct answer to the question, "Which of the following would more than likely be included in the treatment of the patient with depression?" is "All of the above," because effective management of depression often requires an integrated approach. Below, each of these treatments is briefly explained:

Cognitive Therapy: Cognitive therapy, often a part of Cognitive Behavioral Therapy (CBT), focuses on identifying and changing negative thought patterns that can contribute to feelings of depression. By addressing the way individuals perceive their environments and themselves, cognitive therapy can help reduce the symptoms of depression and improve emotional regulation.

Psychopharmacology: This involves the use of medications to manage symptoms of depression. Antidepressants, such as selective serotonin reuptake inhibitors (SSRIs) and tricyclic antidepressants (TCAs), are commonly prescribed to alter brain chemistry and help alleviate depressive symptoms. The choice of medication depends on the individual's specific symptoms, side effects, and other personal factors.

Individual Therapy: This is a one-on-one therapy session with a mental health professional. It provides a safe environment for the

patient to explore feelings, thoughts, and behaviors. Individual therapy can also help patients develop new coping strategies and work through personal issues contributing to their depression.

Group/Family Therapy: Sometimes, the support of a group or family involvement in therapy can be beneficial. Group therapy allows individuals to share experiences and learn from others facing similar challenges, which can offer support and reduce feelings of isolation. Family therapy helps family members understand the patient's depression and teaches ways they can offer support.

Electroconvulsive Therapy (ECT): ECT is a medical treatment most commonly reserved for patients with severe depression who have not responded to other treatments. It involves a brief electrical stimulation of the brain while the patient is under anesthesia. It has been shown to provide rapid, significant improvements in severe symptoms.

Light Therapy: This therapy is primarily used to treat seasonal affective disorder (SAD), a type of depression that occurs at the same time each year, usually in the winter. Light therapy involves exposure to bright light that mimics natural sunlight, which can influence brain chemicals linked to mood and sleep.

Transcranial Magnetic Stimulation (TMS): This is a newer treatment that uses magnetic fields to stimulate nerve cells in the brain to improve symptoms of depression. TMS is typically used when other treatments have not been effective.

In summary, the treatment of depression is tailored to the individual's specific symptoms and may include one or a combination of these therapies. "All of the above" is the correct answer because a comprehensive treatment plan, incorporating various therapeutic approaches, increases the likelihood of effectively managing and treating depression.
