By passing 200-201 Exam, candidates can demonstrate their proficiency in cybersecurity operations and their ability to handle different security incidents.

Cisco Understanding Cisco Cybersecurity Operations Fundamentals Sample Questions (Q373-Q378):

NEW QUESTION # 373

Drag and drop the access control models from the left onto the correct descriptions on the right.

Answer:

Explanation:

NEW QUESTION # 374

What is the virtual address space for a Windows process?

- A. physical location of an object in memory
- B. set of virtual memory addresses that can be used
- C. set of pages that reside in the physical memory
- D. system-level memory protection feature built into the operating system

Answer: B

NEW QUESTION # 375

Which data capture includes payload and header information?

- A. alert data
- B. full packet
- C. session logs
- D. frame check sequence

Answer: B

NEW QUESTION # 376

Refer to the exhibit.

An analyst received this alert from the Cisco ASA device, and numerous activity logs were produced. How should this type of evidence be categorized?

- A. circumstantial
- B. corroborative
- C. best
- D. indirect

Answer: A

Explanation:

The alert from the Cisco ASA device and the numerous activity logs are examples of circumstantial evidence.

Circumstantial evidence is evidence that relies on an inference or deduction to connect it to a conclusion of fact, such as a security incident or an attack. Circumstantial evidence does not directly prove the fact in question, but rather suggests or implies it. In this case, the alert and the logs indicate that a TCP connection attempt was denied by an access group, but they do not directly prove that an attack occurred or who was behind it. There could be other explanations for the denied connection, such as a misconfiguration, a network error, or a legitimate request. Therefore, this type of evidence is circumstantial and requires further investigation and analysis to confirm or rule out the possibility of an attack. NEW QUESTION # 377

Why is HTTPS traffic difficult to screen?

- A. Traffic is tunneled to a specific destination and is inaccessible to others except for the receiver.
- B. Digital certificates secure the session, and the data is sent at random intervals.
- C. The communication is encrypted and the data in transit is secured.
- D. HTTPS is used internally and screening traffic (or external parties) is hard due to isolation.

Answer: C

NEW QUESTION # 378
