By earning this certification, you'll become a recognized expert in using Splunk to analyze and visualize data, troubleshoot issues, and optimize performance.

Splunk Core Certified Power User Exam Sample Questions (Q39-Q44):

NEW QUESTION # 39

A user wants to convert numeric field values to strings and also to sort on those values. Which command should be used first, the eval or the sort?

- A. It doesn't matter whether eval or sort is used first.
- B. You cannot use the sort command and the eval command on the same field.

- C. Use sort first, then convert the numeric to a string with eval.
- D. Convert the numeric to a string with eval first, then sort.

Answer: C

Explanation:

Explanation

The eval command is used to create new fields or modify existing fields based on an expression². The sort command is used to sort the results by one or more fields in ascending or descending order². If you want to convert numeric field values to strings and also sort on those values, you should use the sort command first, then use the eval command to convert the values to strings². This way, the sort command will use the original numeric values for sorting, rather than the converted string values which may not sort correctly. Therefore, option C is correct, while options A, B and D are incorrect.

NEW QUESTION # 40

The eval command 'if' function requires the following three arguments (in order):

- A. Result if false, result if true, boolean expression
- B. Boolean expression, result if false, result if true
- C. Result if true, result if false, boolean expression
- D. Boolean expression, result if true, result if false

Answer: D

Explanation:

The eval command 'if' function requires the following three arguments (in order): boolean expression, result if true, result if false. The eval command is a search command that allows you to create new fields or modify existing fields by performing calculations or transformations on them. The eval command can use various functions to perform different operations on fields. The 'if' function is one of the functions that can be used with the eval command to perform conditional evaluations on fields. The 'if' function takes three arguments: a boolean expression that evaluates to true or false, a result that will be returned if the boolean expression is true, and a result that will be returned if the boolean expression is false. The 'if' function returns one of the two results based on the evaluation of the boolean expression.

NEW QUESTION # 41

What does the following search do?

```
index=corndog type=mysterymeat action=eaten | stats count as corndog_count by user
```

- A. Creates a table that groups the total number of users by vegetarian corndogs.
- B. Creates a table of the total count of mysterymeat corndogs split by user.
- C. Creates a table of the total count of users and split by corndogs.
- D. Creates a table with the count of all types of corndogs eaten split by user.

Answer: B

Explanation:

The search string below creates a table of the total count of mysterymeat corndogs split by user.

| stats count by user | where corndog=mysterymeat

The search string does the following:

It uses the stats command to calculate the count of events for each value of the user field. The stats command creates a table with two columns: user and count.

It uses the where command to filter the results by the value of the corndog field. The where command only keeps the rows where corndog equals mysterymeat.

Therefore, the search string creates a table of the total count of mysterymeat corndogs split by user.

NEW QUESTION # 42

Which of the following statements about event types is true? (select all that apply)

- A. Event types can be tagged.

- B. Event types must include a time range,
- C. Event types categorize events based on a search.
- D. Event types can be a useful method for capturing and sharing knowledge.

Answer: B,C

NEW QUESTION # 43

The Field Extractor (FX) is used to extract a custom field. A report can be created using this custom field. The created report can then be shared with other people in the organization. If another person in the organization runs the shared report and no results are returned, why might this be? (select all that apply)

- A. The dashboard is private.
- B. The person in the organization running the report does not have access to the index.
- C. The extraction is private-
- D. Fast mode is enabled.

Answer: B,C

Explanation:

The Field Extractor (FX) is a tool that helps you extract fields from your events using a graphical interface. You can create a report using a custom field extracted by the FX and share it with other users in your organization. However, if another user runs the shared report and no results are returned, there could be two possible reasons. One reason is that the extraction is private, which means that only you can see and use the extracted field. To make the extraction available to other users, you need to make it global or app-level. Therefore, option C is correct. Another reason is that the other user does not have access to the index where the events are stored. To fix this issue, you need to grant the appropriate permissions to the other user for the index. Therefore, option D is correct. Options A and B are incorrect because they are not related to the field extraction or the report.

NEW QUESTION # 44

.....

The disparity between our SPLK-1002 practice materials and others are distinct. We strive for perfection all these years and get satisfactory results with concerted cooperation between experts, and all questions points in our SPLK-1002 real exam are devised and written base on the real exam.
