CompTIA A+ Certification Exam: Core 2 Sample Questions (Q118-Q123):

NEW QUESTION # 118

A malicious actor uses multiple endpoints to target a single endpoint. Which of the following describes this threat?

- A. Structured Query Language injection
- B. Brute-force attack
- C. On-path attack
- D. Distributed Denial of Service

Answer: D

Explanation:

Using many separate systems (endpoints) to attack one target is the defining characteristic of a Distributed Denial of Service (DDoS) attack. Mike Meyers' Lab Manual defines DDoS as: "An attack on a computer or network device in which multiple computers send data and requests to the device in an attempt to overwhelm it so that it cannot perform normal operations." That description exactly matches the scenario: many endpoints are coordinated to flood one endpoint, preventing legitimate use.

This is different from an on-path (man-in-the-middle) attack, which intercepts traffic between two parties; SQL injection, which targets databases via malicious input; and brute-force attacks, which attempt repeated authentication guesses. The key clue is multiple endpoints working together, which implies distribution (often via botnets) and service disruption by volume. That is why the correct classification is Distributed Denial of Service (D).

NEW QUESTION # 120

An administrator received an email stating that the OS they are currently supporting will no longer be issued security updates and patches. Which of the following is most likely the reason the administrator received this message?

- A. The OS will be considered end of life
- B. The built-in security software is being removed from the next OS version
- C. Support from the computer's manufacturer is expiring
- D. A new version of the OS will be released soon

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

When an OS reaches its end of life (EOL), it no longer receives updates or support, including critical security patches.

From the Quentin Docter Study Guide:

"End-of-life means the manufacturer no longer supports the OS with updates or security patches, which exposes systems to vulnerabilities unless upgraded".

All-in-One Exam Guide adds:

"End-of-life notifications serve as a final warning that continued use of the OS will be insecure and unsupported. It's crucial for administrators to plan migration".

NEW QUESTION # 121

A technician follows proper malware removal procedures but cannot remove all malware. They decide to reload the OS. What should they select?

- A. Clean install

- B. Version upgrade
- C. System restore
- D. OS repair

Answer: A

Explanation:

A clean installation ensures all malware is eliminated by completely wiping and reinstalling the OS. System restore or repair may leave traces.

From QUENTIN DOCTER - COMPTIA A+ COMPLETE study GUIDE:

"If malware cannot be completely removed, perform a clean installation of the operating system. This ensures no remnants remain on the machine."

NEW QUESTION # 122

Which of the following methods would make data unrecoverable but allow the drive to be repurposed?

- A. Degaussing the device
- **B. Performing a low-level format**
- C. Deleting the partitions
- D. Implementing EFS

Answer: B

Explanation:

A low-level format (also referred to as a zero-fill or full format) writes over every sector on a storage device, effectively destroying the existing data and making recovery nearly impossible. Unlike degaussing, which renders the drive unusable, a low-level format maintains the integrity of the device, allowing it to be repurposed or reused.

A). Deleting partitions does not fully erase data; it only removes references in the partition table.

B). EFS (Encrypting File System) encrypts files but does not securely wipe them.

D). Degaussing destroys the magnetic structure of a drive, making it inoperable and not reusable.
