

DVA-C02更新和最新的Amazon認證培訓 - Amazon AWS Certified Developer - Associate

從Google Drive中免費下載最新的VCESoft DVA-C02 PDF版考試題庫: <https://drive.google.com/open?id=1g0WDYSL0kVVBYE-eLwCOUEblkJszzlT0>

VCESoft的DVA-C02考古題是很好的參考資料。這個考古題決定是你一直在尋找的東西。這是為了考生們特別製作的考試資料。它可以讓你在短時間內充分地準備考試，並且輕鬆地通過考試。如果你不想因為考試浪費太多的時間與精力，那麼VCESoft的DVA-C02考古題無疑是你最好的選擇。用這個資料你可以提高你的學習效率，從而節省很多時間。

為了準備DVA-C02考試，候選人應對AWS服務和工具以及在AWS平台上開發和部署應用程序的經驗有深入的了解。AWS提供各種資源，以幫助候選人為考試做準備，包括培訓課程，練習考試和學習指南。

DVA-C02熱門認證 - DVA-C02證照

如果你確定想要通過Amazon DVA-C02認證考試，那麼你選擇購買VCESoft為你提供的培訓資料是很划算的。因為小小的投資時可以換來很大的收穫，使用VCESoft提供的Amazon DVA-C02認證考試測試題目和練習題可以確保你通過考試的。VCESoft是一個個信譽很高的專門為參加Amazon DVA-C02認證考試的IT專業人士提供模擬題及練習題和答案的網站。

DVA-C02 認證是開發人員想在雲計算行業中提升職業生涯的有價值資格。通過獲得此認證，開發人員可以展示他們在 AWS 開發方面的熟練程度，增強他們在雇主和客戶中的信譽。該認證還提供訪問 AWS 專家和資源的社區，以及職業生涯成長和晉升的機會。

最新的 AWS Certified Associate DVA-C02 免費考試真題 (Q264-Q269):

問題 #264

A developer is writing an AWS Lambda function. The developer wants to log key events that occur while the Lambda function runs. The developer wants to include a unique identifier to associate the events with a specific function invocation. The developer adds the following code to the Lambda function:

```
function handler(event, context) {  
  
}
```

Which solution will meet this requirement?

- A. Obtain the request identifier from the AWS request ID field in the event object. Configure the application to write logs to a file.
- B. Obtain the request identifier from the AWS request ID field in the context object. Configure the application to write logs to

standard output.

- C. Obtain the request identifier from the AWS request ID field in the event object. Configure the application to write logs to standard output.
- D. Obtain the request identifier from the AWS request ID field in the context object. Configure the application to write logs to a file.

答案: B

解題說明:

Explanation

<https://docs.aws.amazon.com/lambda/latest/dg/nodejs-context.html>

<https://docs.aws.amazon.com/lambda/latest/dg/nodejs-logging.html>

There is no explicit information for the runtime, the code is written in Node.js.

AWS Lambda is a service that lets developers run code without provisioning or managing servers. The developer can use the AWS request ID field in the context object to obtain a unique identifier for each function invocation. The developer can configure the application to write logs to standard output, which will be captured by Amazon CloudWatch Logs. This solution will meet the requirement of logging key events with a unique identifier.

問題 #265

A healthcare company uses AWS Amplify to host a patient management system. The system uses Amazon API Gateway to expose RESTful APIs. The backend logic of the system is handled by AWS Lambda functions. One of the Lambda functions receives patient data that includes personally identifiable information (PII). The Lambda function sends the patient data to an Amazon DynamoDB table. The company must encrypt all patient data at rest and in transit before the data is stored in DynamoDB. Which configuration will meet these requirements?

- A. Configure the Lambda function to use AWS KMS keys with the AWS Database Encryption SDK to encrypt the patient data before sending the data to DynamoDB.
- B. Use an AWS Step Functions workflow to transfer the data to an Amazon SQS queue. Configure a Lambda function to encrypt the data in the queue before sending the data to the DynamoDB table.
- C. Configure a DynamoDB stream on the table to invoke a Lambda function. Configure the Lambda function to use an AWS KMS key to encrypt the DynamoDB table and to update the table.
- D. Use AWS managed AWS KMS keys to encrypt the data in the DynamoDB table.

答案: A

解題說明:

Encrypting PII at rest and in transit before storing it in DynamoDB ensures end-to-end security.

Using the AWS Database Encryption SDK with KMS keys allows the Lambda function to encrypt data before transmission, meeting security and compliance requirements.

問題 #266

A developer updates an AWS Lambda function that an Amazon API Gateway API uses. The API is the backend for a web application.

The developer needs to test the updated Lambda function before deploying the Lambda function to production. The testing must not affect any production users of the web application.

Which solution will meet these requirements in the MOST operationally efficient way?

- A. Create a new test API stage in API Gateway. Add stage variables to deploy the updated Lambda function to only the test stage. Test the updated Lambda function by using the new stage URL.
- B. Create a new AWS CloudFormation stack to deploy a copy of the entire production API and Lambda function. Use the stack's API URL to test the updated Lambda function.
- C. Create a canary release deployment for the existing API stage. Deploy the API to the existing stage. Test the updated Lambda function by using the existing URL.
- D. Update the API Gateway API endpoint type to private. Deploy the changes to the existing API stage. Test the API by using the existing URL.

答案： A

問題 #267

A developer has code that is stored in an Amazon S3 bucket. The code must be deployed as an AWS Lambda function across multiple accounts in the same AWS Region as the S3 bucket an AWS CloudFormation template that runs for each account will deploy the Lambda function.

What is the MOST secure way to allow CloudFormation to access the Lambda Code in the S3 bucket?

- A. Grant the CloudFormation service role the S3 GetObject permission. Add a Bucket policy to Amazon S3 with the principal of ""
- B. Use a service-based link to grant the Lambda function the S3 GetObject permission Add a resource of "*" to allow access to the S3 bucket.
- C. Use a service-based link to grant the Lambda function the S3 ListBucket and GetObject permissions by explicitly adding the S3 bucket's account number in the resource.
- D. Grant the CloudFormation service role the S3 ListBucket and GetObject permissions. Add a bucket policy to Amazon S3 with the principal of "AWS" (account numbers)

答案： A

解題說明：

Explanation

This solution allows the CloudFormation service role to access the S3 bucket from any account, as long as it has the S3 GetObject permission. The bucket policy grants access to any principal with the GetObject permission, which is the least privilege needed to deploy the Lambda code. This is more secure than granting ListBucket permission, which is not required for deploying Lambda code, or using a service-based link, which is not supported for Lambda functions.

問題 #268

A company needs to harden its container images before the images are in a running state. The company's application uses Amazon Elastic Container Registry (Amazon ECR) as an image registry. Amazon Elastic Kubernetes Service (Amazon EKS) for compute, and an AWS CodePipeline pipeline that orchestrates a continuous integration and continuous delivery (CI/CD) workflow.

Dynamic application security testing occurs in the final stage of the pipeline after a new image is deployed to a development namespace in the EKS cluster. A developer needs to place an analysis stage before this deployment to analyze the container image earlier in the CI/CD pipeline.

Which solution will meet these requirements with the MOST operational efficiency?

- A. Create a new CodePipeline stage that occurs after source code has been retrieved from its repository. Run a security scanner on the latest revision of the source code. Fail the pipeline if there are findings.
- B. Create a new CodePipeline stage that occurs after the container image is built. Configure ECR basic image scanning to scan on image push. Use an AWS Lambda function as the action provider. Configure the Lambda function to check the scan results and to fail the pipeline if there are findings.
- C. Add an action to the deployment stage of the pipeline so that the action occurs before the deployment to the EKS cluster. Configure ECR basic image scanning to scan on image push. Use an AWS Lambda function as the action provider. Configure the Lambda function to check the scan results and to fail the pipeline if there are findings.
- D. Build the container image and run the docker scan command locally. Mitigate any findings before pushing changes to the source code repository. Write a pre-commit hook that enforces the use of this workflow before commit.

答案： B

解題說明：

The solution that will meet the requirements with the most operational efficiency is to create a new CodePipeline stage that occurs after the container image is built. Configure ECR basic image scanning to scan on image push. Use an AWS Lambda function as the action provider. Configure the Lambda function to check the scan results and to fail the pipeline if there are findings. This way, the container image is analyzed earlier in the CI/CD pipeline and any vulnerabilities are detected and reported before deploying to the EKS cluster. The other options either delay the analysis until after deployment, which increases the risk of exposing insecure images, or perform analysis on the source code instead of the container image, which may not capture all the dependencies and configurations that affect the security posture of the image.
