- A. sum()
- B. max()
- C. avg()
- D. count(*)

正解: A、C

質問 # 11

You want to join two database tables, T_CARRIER, and T_CONNECTIONS, to retrieve all carriers, whether they have corresponding connections or not.

Which statements would achieve this? Note: There are 2 correct answers to this question.

- A. SELECT FROM carrier LEFT OUTER JOIN t_connections ON...
- B. SELECT FROM connections RIGHT OUTER JOIN t_carrier ON...
- C. SELECT FROM carrier LEFT INNER JOIN t_connections ON..
- D. SELECT FROM carrier INNERR JOIN t_connections ON...

正解: A、B

質問 # 12

In this nested join below in which way is the join evaluated?

□

- A. From the left to the right in the order of the tables:
 1. a is joined with b
 2. b is joined with c
- B. From the top to the bottom in the order of the on conditions
 1. b is joined with c
 2. a is joined with b
- C. From the bottom to the top in the order of the on conditions:
 1. a is joined with b
 2. b is joined with c
- D. From the right to the left in the order of the tables:
 1. b is joined with c.
 2. b is joined with a.

正解: B

解説:

The nested join is evaluated from the top to the bottom in the order of the ON conditions. This means that the join expression is formed by assigning each ON condition to the directly preceding JOIN from left to right. The join expression can be parenthesized implicitly or explicitly to show the order of evaluation. In this case, the implicit parentheses are as follows:

SELECT * FROM (a INNER JOIN (b INNER JOIN c ON b~c = c~c) ON a~b = b~b) This means that the first join expression is b INNER JOIN c ON b~c = c~c, which joins the columns of tables b and c based on the condition that b~c equals c~c. The second join expression is a INNER JOIN (b INNER JOIN c ON b~c = c~c) ON a~b = b~b, which joins the columns of table a and the result of the first join expression based on the condition that a~b equals b~b. The final result set contains all combinations of rows from tables a, b, and c that satisfy both join conditions.

質問 # 13

When processing an internal table with the statement LOOP AT itab... ENDLOOP, what system variable contains the current row number?

- A. sy-index
- B. sy-linno
- C. sy-tabix
- D. sy-subrc

正解: C

解説:

When processing an internal table with the statement LOOP AT itab... ENDLOOP, the system variable that contains the current row number is sy-tabix. The sy-tabix variable is a predefined field of the system structure sy that holds the index or the row number of the current line in an internal table loop. The sy-tabix variable is initialized with the value 1 for the first loop pass and is incremented by 1 for each subsequent loop pass. The sy-tabix variable can be used to access or modify the current line of the internal table using the index access12.

質問 # 14

Which of the following are personas under the SAP S/4HANA Cloud Extensibility Framework?
(Select 2 correct answers)

- A. Business Expert
- B. Report Writer
- C. Citizen Developer
- D. Workflow Administrator

正解: A、C

解説:

Comprehensive and Detailed Explanation from Exact Extract:

SAP S/4HANA Cloud Extensibility Framework defines personas for extension activities:
