Unlike other question banks that are available on the market, our Analytics-Admn-201 guide dumps specially proposed different versions to allow you to learn not only on paper, but also to use mobile phones to learn. This greatly improves the students' availability of fragmented time. You can choose the version of Analytics-Admn-201 Learning Materials according to your interests and habits. And if you buy all of the three versions, the price is quite preferential and you can enjoy all of the Analytics-Admn-201 study experiences.

Salesforce Analytics-Admn-201 Exam Overview:

Certification Vendor:	Salesforce (Tableau)
Exam Name:	Salesforce Certified Tableau Server Administrator (Analytics-Admn-201)
Exam Number:	Analytics-Admn-201
Available Languages:	English
Related Certifications:	Tableau Desktop Specialist Tableau Certified Data Analyst Tableau Server Certified Associate
Sample Questions:	Salesforce Analytics-Admn-201 Sample Questions
Exam Way:	Online proctored or test center-based exam delivery depending on region and provider policies.
Pre Condition:	Recommended prior experience with Tableau Desktop and basic knowledge of server administration concepts.

New PDF Analytics-Admn-201 Cram Exam | Efficient Salesforce Analytics-Admn-201: Salesforce Certified Tableau Server Administrator 100% Pass

Working in IT industry, IT people most want to attend Salesforce certification exam. As a widely recognized certification examination, Salesforce certification exams are becoming more and more popular. Among them, Salesforce Analytics-Admn-201 certification test is the most important exam. Having Analytics-Admn-201 certificate proves you have high skills. Owing to its importance, it is very difficult to pass Salesforce Analytics-Admn-201 exam successfully. Although to pass the exam is hard, you also don't need to worry about it. ITExamSimulator exam dumps will help you sail through Analytics-Admn-201 test.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 2	Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 3	Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 4	Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.
Topic 5	Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Salesforce Certified Tableau Server Administrator Sample Questions (Q29-Q34):

NEW QUESTION # 29

Which two commands are valid and complete commands? (Choose two.)

- A. tsm maintenance backup
- B. tsm maintenance restore
- C. tsm maintenance cleanup
- D. tsm maintenance ziplogs

Answer: C,D

Explanation:

TSM commands manage Tableau Server maintenance--let's validate their syntax:

Command Requirements:

Some need arguments (e.g., file paths); others are standalone.

Valid and Complete: Must work as-is without errors.

Option C (tsm maintenance cleanup): Correct.

Details: Removes temporary files and old logs--no arguments required (optional flags like -l exist).

Use: tsm maintenance cleanup--runs fully.

Option D (tsm maintenance ziplogs): Correct.

Details: Creates a zip of logs (e.g., tsm-logs.zip)--no arguments needed (optional -d for date range).

Use: tsm maintenance ziplogs--complete and valid.

NEW QUESTION # 30

Why might an administrator configure a dedicated node to run only the Backgrounder process?

- A. To isolate resource-intensive background tasks (like extract refreshes) from user-facing processes
- B. To enable SSL termination
- C. To reduce licensing costs
- D. Because Backgrounder cannot run alongside VizQL Server under any circumstances

Answer: A

Explanation:

Extract refreshes and other background jobs can be CPU/memory intensive. Dedicating a node to Backgrounder isolates that load so it doesn't degrade performance for interactive users hitting VizQL Server or the Gateway. Backgrounder can technically coexist with other processes on a node; isolation is a best practice, not a hard requirement.

NEW QUESTION # 31

Which authentication method allows users to sign in to Tableau Server using credentials from an external identity provider via SAML?

- A. Trusted authentication
- B. Local authentication
- C. Single Sign-On (SSO) via SAML
- D. Kerberos delegation

Answer: C

Explanation:

SAML-based SSO integrates Tableau Server with an external Identity Provider (IdP) so users authenticate once and gain access without separate Tableau credentials. Local authentication uses Tableau's own credential store; trusted authentication is used for embedding without prompting for login; Kerberos delegation supports single sign-on to underlying data sources, not initial server login.

NEW QUESTION # 32

An administrator wants to add a second node to an existing Tableau Server cluster. What must be true of the second node before installation begins?

- A. It must have the same amount of RAM as the initial node
- B. It must be running a different operating system than the initial node
- C. It must be able to communicate with the initial node over the required ports, and have the Tableau Server bootstrap file
- D. It must already have PostgreSQL installed

Answer: C

Explanation:

Adding a node requires generating a bootstrap file (tsm topology nodes get-bootstrap-file) on the initial node and copying it to the new node, along with open network communication between nodes on Tableau's required ports. Hardware need not match exactly, PostgreSQL is installed as part of the Tableau Server package (not a prerequisite), and mixed operating systems are not supported within a single cluster.

NEW QUESTION # 33

What type of information is stored in the tsm maintenance backup -f<filename>.tsbak command?

- A. SMTP server settings
- B. Repository data

- C. Topology data
- D. Notification settings

Answer: B

Explanation:

The tsm maintenance backup command creates a backup file (with a .tsbak extension) that captures critical data needed to restore Tableau Server in case of failure or migration. This backup primarily includes:

Repository data: This encompasses the PostgreSQL database, which stores metadata such as workbooks, data sources, user information, permissions, schedules, and subscriptions.

Configuration data: This includes server settings like authentication methods, port configurations, and service layouts, but it does not include topology data as a separate entity (topology is part of the configuration).

The command does not back up the following:

Extract files (stored in the File Store), which must be backed up separately if needed. Log files, which are archived using tsm maintenance ziplogs.

NEW QUESTION # 34
