1. Cloud Computing - ANSWER ✓ The on-demand delivery of IT resources over the Internet with pay-as-you-go pricing.
2. Cloud Deployment Model: Cloud - ANSWER ✓ Fully deployed in the cloud; all parts of the application run on AWS.
3. Cloud Deployment Model: Hybrid - ANSWER ✓ Connects on-premises infrastructure to cloud infrastructure.
4. Cloud Deployment Model: On-Premises (Private Cloud) - ANSWER ✓ Uses virtualization and resource management tools in a company's own data center; not true cloud computing.
5. Benefit of Cloud: Trade CapEx for OpEx - ANSWER ✓ Avoids large upfront investments in hardware (Capital Expense) and pays only for what you use (Operational Expense).
6. Benefit of Cloud: Economies of Scale - ANSWER ✓ AWS's massive scale allows them to offer lower prices than if a company ran its own data center.
7. Benefit of Cloud: Stop Guessing Capacity - ANSWER ✓ You can scale resources up or down automatically, so you don't have to predict usage.
8. Benefit of Cloud: Increase Speed and Agility - ANSWER ✓ Resources are available with a few clicks, reducing the time to make them available to developers from weeks to minutes.

### WGU Cloud Deployment and Operations Sample Questions (Q57-Q62):

#### NEW QUESTION # 57

(Which two protocols are supported in security group rules? Choose 2 answers.)

- A. BGP
- B. MPLS
- C. UDP
- D. ICMP

**Answer: C,D**

Explanation:

Security group rules in AWS support the Internet Control Message Protocol (ICMP) and User Datagram Protocol (UDP) for defining inbound and outbound traffic rules. These protocols are commonly used for network communication and monitoring. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, Security Groups) states, "Security groups support protocols like ICMP for diagnostic traffic and UDP for streaming or low-latency applications, allowing fine-grained control over instance access." BGP and MPLS are routing or network layer protocols not supported by security group rules.

#### NEW QUESTION # 58

(Which feature should be configured to deploy a static website to AWS?)

- A. Bucket properties
- B. CloudTrail events
- C. S3 Versioning
- D. RDS Proxy

**Answer: A**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To deploy a static website to AWS, the bucket properties of an Amazon S3 bucket should be configured, specifically enabling static website hosting. This involves setting the bucket policy to allow public read access and configuring the index and error documents. The WGU Cloud Deployment and Operations Study Guide (Section 2.1, S3 Static Website Hosting) states, "Configuring bucket properties for static website hosting in S3 involves enabling the website endpoint, setting an index document (e.g., index.html), and applying a bucket policy for public access, making it suitable for hosting static content." RDS Proxy, S3 Versioning, and CloudTrail events are not relevant to this use case.

#### NEW QUESTION # 59

(An administrator sets up a route table with the default outbound route via an internet gateway and links it to a VPC. Which solution should be used to ensure the route takes effect?)

- A. Create an edge association

- **B. Create a subnet association**
- C. Configure propagation
- D. Configure tags

**Answer: B**

Explanation:

To ensure the route table with a default outbound route via an internet gateway takes effect, the administrator must create a subnet association, linking the route table to specific subnets within the VPC. This association applies the routing rules to the subnet's traffic. The WGU Cloud Deployment and Operations Study Guide (Section 3.2, VPC Routing) states, "A route table must be associated with a subnet (subnet association) to enforce routing rules, such as the default route to an internet gateway, ensuring outbound traffic follows the defined path." Propagation, tags, and edge associations do not activate the route.

#### **NEW QUESTION # 60**

(Which action must be used to create a metric filter in the Amazon CloudWatch console?)

- A. Enable an alarm
- B. Specify a stream
- **C. Select a log group**
- D. Define a trace

**Answer: C**

Explanation:

To create a metric filter in the Amazon CloudWatch console, the first step is to select a log group from which the log data will be analyzed. A log group contains log streams, and metric filters are applied to the log data within these groups to extract metrics based on patterns. The WGU Cloud Deployment and Operations Study Guide (Section 4.2, CloudWatch Logs) specifies that the process begins by navigating to the CloudWatch console, selecting a log group, and then defining the filter pattern. Actions like enabling an alarm, defining a trace, or specifying a stream are subsequent or unrelated steps.

#### **NEW QUESTION # 61**

(Which CloudWatch metric filter includes log events with the word ERROR but excludes log events with the word WARNING?)

- A. ?ERROR ?WARN
- **B. ERROR -WARN**
- C. ERROR WARN
- D. "ERROR" WARN

**Answer: B**

Explanation:

A metric filter in Amazon CloudWatch Logs can be used to search for specific terms in log data and create metrics based on the matches. To include log events with the word "ERROR" and exclude those with the word "WARNING," the correct syntax involves using a filter pattern with a positive match for "ERROR" and a negation for "WARNING." The correct pattern is "ERROR -WARN," where the minus sign (-) indicates exclusion of log events containing "WARN." According to the WGU Cloud Deployment and Operations Study Guide (Section 4.2, CloudWatch Logs), metric filters use a pattern-based syntax where terms are included or excluded using positive matches and the negation operator (-). This ensures that only logs with "ERROR" and without "WARN" are processed into the metric.
