Interactive SPLK-1002 Questions - Free SPLK-1002 Vce Dumps

To know well your level of SPLK-1002 Exam Preparation, we offer you the online test engine version which is an exam simulation to help you in knowing your weak point in SPLK-1002 practice test and therefore provide an opportunity to fulfill your deficiencies prior to Splunk real exam. Once there are latest versions released, we will send it to your email immediately.

Splunk Core Certified Power User Exam Sample Questions (Q125-Q130):

NEW QUESTION # 125

A macro has another macro nested within it, and this inner macro requires an argument. How can the user pass this argument into the SPL?

- A. There is no way to pass an argument to the inner macro.
- B. An argument can be passed through the outer macro.

- C. An argument can be passed to the inner macro by nesting parentheses.
- D. An argument can be passed to the outer macro by nesting parentheses.

Answer: C

Explanation:

Explanation

The correct answer is D. An argument can be passed to the inner macro by nesting parentheses.

A search macro is a way to reuse a piece of SPL code in different searches. A search macro can take arguments, which are variables that can be replaced by different values when the macro is called. A search macro can also contain another search macro within it, which is called a nested macro. A nested macro can also take arguments, which can be passed from the outer macro or directly from the search string.

To pass an argument to the inner macro, you need to use parentheses to enclose the argument value and separate it from the outer macro argument. For example, if you have a search macro named `outer_macro` (1) that contains another search macro named `inner_macro` (2), and both macros take one argument each, you can pass an argument to the inner macro by using the following syntax:

```
outer_macro (argument1, inner_macro (argument2))
```

This will replace the `argument1` and `argument2` with the values you provide in the search string. For example, if you want to pass "foo" as the `argument1` and "bar" as the `argument2`, you can write:

```
outer_macro ("foo", inner_macro ("bar"))
```

This will expand the macros with the corresponding arguments and run the SPL code contained in them.

NEW QUESTION # 126

Which of the following statements about tags is true?

- A. Tags are case insensitive.
- B. Tags are created at index time.
- C. Tags can make your data more understandable.
- D. Tags are searched by using the syntax tag: <fieldname>

Answer: C

NEW QUESTION # 127

Which of the following statements about tags is true?

- A. Tags are case insensitive.
- B. Tags are created at index time.
- C. Tags can make your data more understandable.
- D. Tags are searched by using the syntax tag: <fieldname>

Answer: C

Explanation:

Explanation

Tags are aliases or alternative names for field values in Splunk. They can make your data more understandable by using common or descriptive terms instead of cryptic or technical terms. For example, you can tag a field value such as "200" with "OK" or "success" to indicate that it is a HTTP status code for a successful request.

Tags are case sensitive, meaning that "OK" and "ok" are different tags. Tags are created at search time, meaning that they are applied when you run a search on your data. Tags are searched by using the syntax tag:<tagname>, where <tagname> is the name of the tag you want to search for.

NEW QUESTION # 128

Based on the macro definition shown below, what is the correct way to execute the macro in a search string?

Name *
Enter the name of the macro. If the search macro takes an argument, indicate this by appending the number of arguments to the name. For example: mymacro(2)

convert_sales(3)

Definition *
Enter the string the search macro expands to when it is referenced in another search. If arguments are included, enclose them in dollar signs. For example: \$arg1\$

```
stats sum(price) as USD by product_name
| eval $currency$="$symbol$".tostring(round(USD*$rate$,2),
"commas") | eval USD="$" + tostring(USD,"commas")
```

☐ Use eval-based definition?

Arguments
Enter a comma-delimited string of argument names. Argument names may only contain alphanumeric, '_' and '-' characters.

currency,symbol,rate

- A. 'convert_sales(\$euro\$, \$€\$, \$.79\$)'
- B. 'convert_sales(euro, €, .79)'
- C. "convert_sales(euro, €, .79)"
- D. "convert_sales(\$euro\$, \$€\$, \$.79\$)"

Answer: A

Explanation:

NEW QUESTION # 129

Why would the transaction command be used instead of the stats command?

- A. The transaction command can perform calculations on fields.
- B. The transaction command keeps the raw data for each event.
- C. The transaction command is less resource-intensive.
- D. The transaction command has better search-time performance.

Answer: B

Explanation:

The transaction command is used when you need to group events and preserve the raw event data. This is essential in situations where context is important and you need to maintain the original details of each event.
