We present our Salesforce MuleSoft-Integration-Architect-I real questions in PDF format. It is beneficial for those applicants who are busy in daily routines. The MuleSoft-Integration-Architect-I PDF QUESTIONS contains all the exam questions which will appear in the real test. You can easily get ready for the examination in a short time by just memorizing MuleSoft-Integration-Architect-I Actual Questions.

Our brand has marched into the international market and many overseas clients purchase our MuleSoft-Integration-Architect-I study materials online. As the saying goes, Rome is not build in a day. The achievements we get hinge on the constant improvement on the quality of our MuleSoft-Integration-Architect-I study materials and the belief we hold that we should provide the best service for the clients. The great efforts we devote to the MuleSoft-Integration-Architect-I Study Materials and the experiences we accumulate for decades are incalculable. All of these lead to our success of MuleSoft-Integration-Architect-I study materials and high prestige.

MuleSoft-Integration-Architect-I Simulation Questions & Latest MuleSoft-Integration-Architect-I Practice Materials

We provide you with our best Salesforce MuleSoft-Integration-Architect-I exam study material, which builds your ability to get high-paying jobs. Salesforce MuleSoft-Integration-Architect-I Exam Dumps includes Salesforce MuleSoft-Integration-Architect-I Dumps PDF format, desktop MuleSoft-Integration-Architect-I practice exam software, and web-based MuleSoft-Integration-Architect-I practice test software.

Salesforce Certified MuleSoft Integration Architect I Sample Questions

(Q235-Q240):

NEW QUESTION # 235

A retail company is implementing a MuleSoft API to get inventory details from two vendors by Invoking each vendor's online applications. Due to network issues, the invocations to the vendor applications are timing out intermittently, but the requests are successful after re-invoking each vendor application.

What is the most performant way of implementing the API to invoke each vendor application and to retry invocations that generate timeout errors?

- A. Use a Scatter-Gather scope to invoke each vendor application on a separate route.
Use an Until-Successful scope in each route to retry requests that raise timeout errors.
- B. Use a Choice scope to Invoke each vendor application on a separate route.
Place the Choice scope inside an Until-Successful scope to retry requests that raise timeout errors.
- C. Use a For-Each scope to invoke the two vendor applications in series, one after the other.
Place the For-Each scope inside an Until-Successful scope to retry requests that raise timeout errors.
- D. Use a Round-Robin scope to invoke each vendor application on a separate route.
Use a Try-Catch scope in each route to retry requests that raise timeout errors.

Answer: A

Explanation:

To efficiently handle the invocation of vendor applications and retry requests that generate timeout errors, the most performant way is:

* Scatter-Gather Scope: Use a Scatter-Gather scope to invoke each vendor application in parallel. This approach allows the API to send requests to both vendors simultaneously, reducing overall processing time.

* Until-Successful Scope: Inside each route of the Scatter-Gather scope, use an Until-Successful scope to handle retries. The Until-Successful scope will retry the request in case of timeout errors until the request succeeds or the maximum retry limit is reached. This combination ensures that the API can handle intermittent network issues efficiently while minimizing redundant transactions and maximizing performance.

NEW QUESTION # 236

A Mule application contains a Batch Job with two Batch Steps (Batch_Step_1 and Batch_Step_2). A payload with 1000 records is received by the Batch Job.

How many threads are used by the Batch Job to process records, and how does each Batch Step process records within the Batch Job?

- A. Each Batch Job uses SEVERAL THREADS for the Batch Steps Each Batch Step instance receives ONE record at a time as the payload, and BATCH STEP INSTANCES execute IN PARALLEL to process records and Batch Steps in ANY order as fast as possible
- B. Each Batch Job uses SEVERAL THREADS for the Batch Steps Each Batch Step instance receives ONE record at a time as the payload, and RECORDS are processed IN PARALLEL within and between the two Batch Steps
- C. Each Batch Job uses a SINGLE THREAD to process a configured block size of record Each Batch Step instance receives A BLOCK OF records as the payload, and BLOCKS of records are processed IN ORDER
- D. Each Batch Job uses a SINGLE THREAD for all Batch steps Each Batch step instance receives ONE record at a time as the payload, and RECORDS are processed IN ORDER, first through Batch_Step_1 and then through Batch_Step_2

Answer: B

Explanation:

* Each Batch Job uses SEVERAL THREADS for the Batch Steps

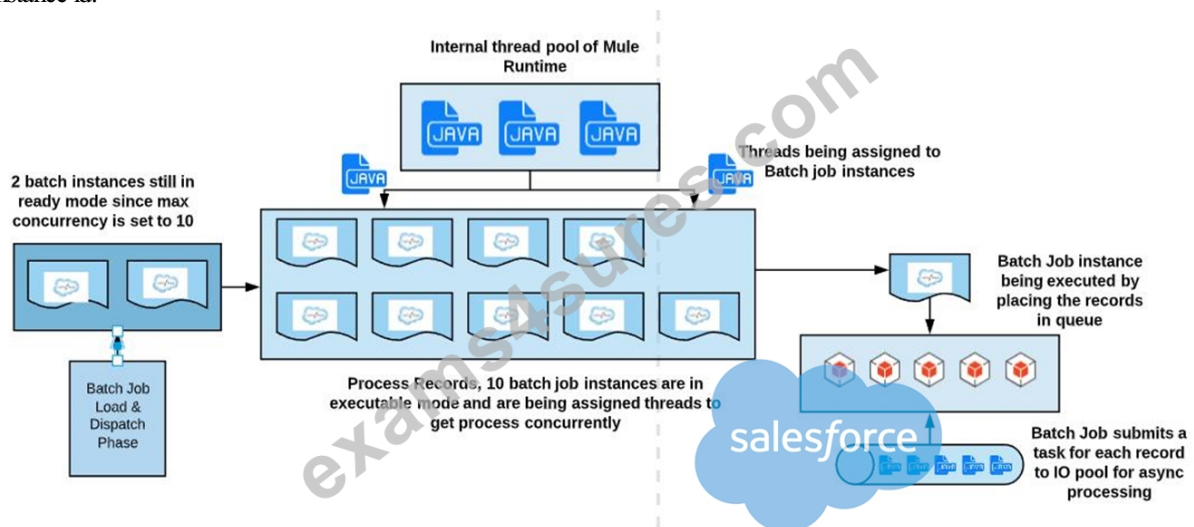

* Each Batch Step instance receives ONE record at a time as the payload. It's not received in a block, as it does not wait for multiple records to be completed before moving to next batch step. (So Option D is out of choice)

* RECORDS are processed IN PARALLEL within and between the two Batch Steps.

* RECORDS are not processed in order. Let's say if second record completes batch_step_1 before record 1, then it moves to batch_step_2 before record 1. (So option C and D are out of choice)

* A batch job is the scope element in an application in which Mule processes a message payload as a batch of records. The term batch job is inclusive of all three phases of processing: Load and Dispatch, Process, and On Complete.

* A batch job instance is an occurrence in a Mule application whenever a Mule flow executes a batch job. Mule creates the batch job instance in the Load and Dispatch phase. Every batch job instance is identified internally using a unique String known as batch job instance id.

NEW QUESTION # 237

An organization has deployed runtime fabric on an eight node cluster with performance profile. An API uses and non persistent object store for maintaining some of its state data. What will be the impact to the state data if server crashes?

- A. State data is preserved
- B. State data is rolled back to a previously saved version
- C. State data is preserved as long as more than one more is unaffected by the crash
- **D. State data is lost**

Answer: D

NEW QUESTION # 238

An API client makes an HTTP request to an API gateway with an Accept header containing the value "application". What is a valid HTTP response payload for this request in the client requested data format?

- A. status("healthy")
- B. status: healthy
- **C. {"status": "healthy"}**
- D. <status>healthy</status>

Answer: C

NEW QUESTION # 239

A stock trading company handles millions of trades a day and requires excellent performance and reliability within its stock trading system. The company operates a number of event-driven APIs implemented as Mule applications that are hosted on various customer-hosted Mule clusters and needs to enable message exchanges between the APIs within their internal network using shared message queues.

What is an effective way to meet the cross-cluster messaging requirements of its event-driven APIs?

- A. Non-transactional JMS operations with a reliability pattern and manual acknowledgements
- B. Persistent VM queues with automatic acknowledgements
- C. extended Architecture (XA) transactions and XA connected components with manual acknowledgements
- **D. JMS transactions with automatic acknowledgements**

Answer: D

Explanation:

- * JMS (Java Message Service): JMS is a robust messaging standard that supports reliable and asynchronous communication. It allows message producers and consumers to exchange messages via a common message broker.
- * Transactions with Automatic Acknowledgements: Utilizing JMS transactions ensures that messages are processed reliably. The automatic acknowledgement mode means that once the consumer receives the message, it acknowledges the broker automatically, ensuring that no messages are lost.
- * Performance and Reliability: JMS transactions offer both high performance and reliability. By enabling transactions, each message processing step can be committed or rolled back, ensuring data integrity.
- * Cross-Cluster Messaging: For a stock trading company dealing with millions of trades, using JMS transactions allows for consistent and reliable message delivery across different clusters in their network. This approach is more suitable compared to non-transactional or VM queues due to the scale and reliability requirements.
- * Event-Driven APIs: The APIs can leverage the transactional nature of JMS to ensure that messages exchanged between different services are reliable and can recover gracefully from failures.

JMS 2.0 Specification: Oracle JMS 2.0
