Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Portworx-Enterprise-Professional Prüfungsfragen mit Lösungen (Q54-Q59):

54. Frage

Which flag in the Portworx StorageCluster spec enables telemetry?

- A. spec.telemetry.enabled

- B. spec.autopilot.enabled
- C. spec.csi.enabled

Antwort: A

Begründung:

Comprehensive and Detailed Explanation From Exact Extract:

Telemetry in Portworx refers to the automated collection and reporting of cluster performance and health metrics to Pure1 or other monitoring services. To enable telemetry, the spec.telemetry.enabled flag must be set to true in the StorageCluster Custom Resource Definition (CRD). This setting activates the telemetry pod on each node, which collects data such as resource usage, storage capacity, and errors, then securely uploads it to Pure Storage's management platform. Enabling telemetry helps administrators gain insights into cluster performance trends, preemptively identify issues, and optimize resource utilization. The Portworx operator respects this flag during installation and upgrades to ensure telemetry is consistently configured. Neither spec.autopilot.enabled (which controls the Autopilot feature) nor spec.csi.enabled (which controls CSI driver deployment) affects telemetry settings. Official Portworx documentation highlights this flag as critical for activating health monitoring and analytics features within Portworx clusters **【Pure Storage Portworx Telemetry Guide source】** .

55. Frage

When updating the Portworx StorageCluster object to mount the SSL certificate secret, which path should be specified for the AWS_CA_BUNDLE environment variable?

- A. /etc/pwx/objectstore-cert/objectstore.pem
- B. /opt/certs/objectstore.pem
- C. /etc/pwx/objectstore-cert/px-s3-certs

Antwort: B

Begründung:

Comprehensive and Detailed Explanation From Exact Extract:

When configuring Portworx to communicate securely with an AWS S3-compatible Object Store using custom SSL certificates, the AWS_CA_BUNDLE environment variable must point to the mounted certificate file location. The correct path for this in the StorageCluster spec is /opt/certs/objectstore.pem. This file contains the Certificate Authority (CA) bundle trusted by Portworx to validate TLS connections to the object store. Ensuring this path is correctly specified and the certificate secret properly mounted is critical to prevent TLS handshake failures and enable secure communication. Portworx documentation and configuration samples specify /opt/certs/objectstore.pem as the standard path for the CA bundle within Portworx containers when integrating with custom or private certificate authorities **【Pure Storage Portworx Security Guide source】** .

56. Frage

What is the recommended practice for managing the lifecycle of snapshots in Portworx?

- A. Manually delete old snapshots to free up space.
- B. Retain all snapshots indefinitely.
- C. Configure the retention policies.

Antwort: C

Begründung:

Comprehensive and Detailed Explanation From Exact Extract:

The recommended approach to managing Portworx snapshots is to configure retention policies that automatically govern the lifecycle of snapshots, including their expiration and deletion. These policies ensure that snapshots are retained only as long as needed, preventing uncontrolled accumulation that can consume excessive storage and degrade performance. By setting retention rules, administrators can automate snapshot cleanup, enforce compliance requirements, and optimize resource usage. Manual deletion is error-prone and inefficient at scale, and retaining all snapshots indefinitely can lead to capacity exhaustion and management challenges. Portworx documentation provides detailed guidance on defining snapshot retention schedules, including time-based expiration and count limits, enabling administrators to maintain a balance between data protection and storage efficiency **【Pure Storage Portworx Snapshot Management Guide source】** .

57. Frage

An application team is preparing to deploy an ElasticSearch application and wants all Portworx volumes created in 6 specific Kubernetes nodes. Which Portworx feature should they use to achieve this?

- A. Autopilot
- B. Volume placement strategy
- C. Stork

Antwort: B

Begründung:

Comprehensive and Detailed Explanation From Exact Extract:

To ensure Portworx volumes for an ElasticSearch application are created only on specific Kubernetes nodes, the Volume Placement Strategy feature is used. This feature allows administrators to define node affinity or anti-affinity rules that restrict volume provisioning to a subset of nodes. By tagging the six nodes with appropriate labels and configuring the StorageClass or volume parameters to respect these labels, Portworx guarantees that volumes will only be provisioned on those nodes. This targeted volume placement is critical for performance optimization, data locality, and compliance with infrastructure constraints. Autopilot automates scaling and Stork manages storage-aware scheduling but does not directly control volume node placement. The Portworx deployment documentation highlights Volume Placement Strategy as the tool for precise volume-to-node mapping in Kubernetes clusters **【Pure Storage Portworx Deployment Guide source】** .

58. Frage

Which command could be used to install Portworx on Kubernetes using the PX-Operator?

- A. `kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"`
- B. `curl -O px-ag-install.sh -L "https://install.portworx.com/$PXVER/air-gapped?kbver=$KBVER"`
- C. `kubectl apply -f "https://install.portworx.com/<portworx_version>?operator=true&mc=false&kbver=1.25.0&ns=portworx&b=true&kd=type%3Dgpg3%2Csize%3D150&s=%2F%2F22type%3Dgpg3%2Csize%3D150&c=px-cluster-0584f7fb-b6be-4608-800c-2ac5fb8069e0&stork=true&csi=true&mon=true&tel=false&st=k8s&promop=true"`

Antwort: A

Begründung:

Comprehensive and Detailed Explanation From Exact Extract:

The officially recommended method to install Portworx with Kubernetes Operator support is using the PX-Operator manifest. This is done by applying the manifest URL with the `comp=pxoperator` parameter. The command: `kubectl apply -f "https://install.portworx.com/<portworx_version>?comp=pxoperator&kbver=<k8s-version>&ns=portworx"` deploys the Portworx Operator, which manages Portworx lifecycle operations such as installation, upgrades, and configuration changes within the Kubernetes cluster. Specifying the Kubernetes version (kbver) and namespace (ns) ensures compatibility and proper scoping. This operator-centric installation enables more efficient management and automation compared to standalone scripts or manual installations. Portworx official operator installation documentation confirms this approach as the best practice for production deployments, streamlining Portworx management in Kubernetes environments **【Pure Storage Portworx Operator Installation Guide source】**.
