

# New F5CAB5 Test Blueprint | Certification F5CAB5 Exam Cost

We are well acknowledged for we have a fantastic advantage over other vendors - We offer you the simulation test with the Soft version of our F5CAB5 exam engine: in order to let you be familiar with the environment of F5CAB5 test as soon as possible. Under the help of the real simulation, you can have a good command of key points which are more likely to be tested in the real F5CAB5 test. Therefore that adds more confidence for you to make a full preparation of the upcoming F5CAB5 exam.

All kinds of exams are changing with dynamic society because the requirements are changing all the time. To keep up with the newest regulations of the BIG-IP Administration Support and Troubleshooting exam, our experts keep their eyes focusing on it. Expert team not only provides the high quality for the F5CAB5 Quiz guide consulting, also help users solve problems at the same time, leak fill a vacancy, and finally to deepen the user's impression, to solve the problem of BIG-IP Administration Support and Troubleshooting test material and no longer make the same mistake.

## First-grade New F5CAB5 Test Blueprint - Trustable Source of F5CAB5 Exam

Many candidates are interested in our software test engine of F5CAB5. This version is software. If you download and install on your personal computer online, you can copy to any other electronic products and use offline. The software test engine of F5CAB5 is very practical. It can be used on Phone, Ipad and so on. You can study any time anywhere you want. Comparing to PDF version, the software test engine of F5 F5CAB5 also can simulate the real exam scene so that you can overcome your bad mood for the real exam and attend exam casually.

### F5 F5CAB5 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Given a scenario, interpret traffic flow: This domain covers understanding traffic patterns through client-server communication analysis and interpreting traffic graphs and SNMP results.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>Identify network level performance issues: This section focuses on diagnosing network problems including packet capture needs, interface availability, packet drops, speed and duplex settings, and TCP profile optimization.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>Determine resource utilization: This domain covers analyzing system resources including control plane versus data plane usage, CPU statistics per virtual server, interface statistics, and disk and memory utilization.</li> </ul>

## F5 BIG-IP Administration Support and Troubleshooting Sample Questions (Q30-Q35):

### NEW QUESTION # 30

A BIG-IP Administrator notices that one of the servers that runs an application is NOT receiving any traffic.

The BIG-IP Administrator examines the configuration status of the application and observes the displayed monitor configuration and affected pool member status.

What is the possible cause of this issue? (Choose one answer)

- A. The application is NOT responding with the expected Receive String.
- B. HTTP 1.1 is NOT appropriate for monitoring purposes.
- C. The BIG-IP device is NOT able to reach the pool.
- D. The node health monitor is NOT responding.

**Answer: D**

Explanation:

The key clue in the exhibit is the pool member's availability showing "Offline (Enabled) - Parent down". In BIG-IP terminology, a pool member inherits the status of its parent node. If the node is marked down (for example, by a node-level monitor or a default "node is down" condition), then all pool members using that node IP will also be marked down and will not receive any traffic, even if the application service on the member port might be healthy.

While the HTTPS monitor configuration (send/receive strings) is displayed, the status specifically indicates a node (parent) failure, not a service-level failure. If the problem were the application not matching the receive string, you would typically see the member down due to the member's monitor failing (and the status would reflect monitor failure details), rather than "parent down." Option D is too broad; BIG-IP can generally reach the subnet (other servers work), and this symptom points to a specific node condition. Option C is incorrect because HTTP/1.1 is commonly used for monitoring and is valid when properly formatted (especially with a Host header). Therefore, the most likely cause is that the node health monitor is not responding, causing the node- and consequently the member- to be marked down.

### NEW QUESTION # 31

A BIG-IP Administrator needs to determine why only one pool member is showing connections from the virtual server, resulting in uneven load balancing.

What two reasons would cause uneven load balancing? (Choose two answers)

- A. Monitors have marked down multiple pool members.
- B. The pool has a persistence profile configured.
- C. All pool members are marked down.
- D. The virtual server is marked down.

**Answer: A,B**

Explanation:

Uneven load balancing on a BIG-IP system typically occurs when traffic is not distributed evenly across all available pool members. One common reason is that monitors have marked down multiple pool members (Option B). When health monitors fail for specific pool members, BIG-IP automatically removes those members from load-balancing decisions. As a result, traffic is sent only to the remaining healthy member, creating the appearance that load balancing is not functioning correctly. This behavior is expected and aligns with BIG-IP's design to ensure traffic is sent only to healthy resources.

Another frequent cause is the presence of a persistence profile on the pool or virtual server (Option C).

Persistence (such as source address or cookie persistence) forces subsequent client connections to be sent to the same pool

member for session continuity. While persistence is critical for certain applications, it can override the load-balancing algorithm and cause most or all traffic to be directed to a single pool member, especially during low traffic volumes or testing scenarios. The other options are incorrect because a virtual server marked down (Option A) would not pass traffic at all, and all pool members marked down (Option D) would result in no connections rather than uneven distribution. This analysis follows standard BIG-IP troubleshooting methodology using pool status, monitor results, and persistence configuration review.

### NEW QUESTION # 32

Which menu should you use on the BIG-IP Configuration Utility to generate a QKView support file? (Choose one answer)

- A. System > Support
- B. System > Configuration
- C. System > Logs
- D. System > Archive

**Answer: A**

Explanation:

Comprehensive and Detailed 150 to 250 Words Explanation From BIG-IP Administration, Support, and Troubleshooting Documents:

AQKViewfile is the primary diagnostic support bundle used by F5 Support to troubleshoot BIG-IP system issues. It contains comprehensive system information, including running configuration, licensing details, module provisioning, hardware status, software versions, log files, statistics, and the output of numerous diagnostic commands. Generating a QKView is a standard and recommended first step when investigating performance problems, configuration issues, or when opening a support case with F5. In the BIG-IP Configuration Utility (GUI), the correct and supported location to generate a QKView is System > Support. This menu is specifically designed for support and troubleshooting operations. From this section, administrators can generate a QKView file, monitor its creation progress, download it locally, or upload it directly to F5 iHealth for automated analysis. This workflow is clearly documented in BIG-IP Administration and Support guides and aligns with F5 best practices.

The other menu options are not appropriate:

- \* System > Configuration is used for system-wide settings such as DNS, NTP, and device identity.
- \* System > Archive is used to create UCS backup files, which are configuration backups, not diagnostic bundles.
- \* System > Logs is used only for viewing system logs, not generating support files.

Therefore, System > Support is the correct and only valid answer.

### NEW QUESTION # 33

In the BIG-IP Configuration Utility, a user requests a single screen view to determine the status of all Virtual Servers and associated pool members, as well as any iRules in use. Where should the BIG-IP Administrator instruct the user to find this view?

- A. Local Traffic > Monitors
- B. Statistics
- C. Local Traffic > Network Map
- D. Local Traffic > Virtual Servers

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From BIG-IP Administration Support and Troubleshooting documents: To confirm functionality across a complex environment, the "Network Map" is the most efficient troubleshooting tool in the Configuration Utility<sup>43</sup>. It provides a hierarchical, visual representation of the traffic management objects<sup>44</sup>. A single glance allows the administrator to see the status of a Virtual Server (Green/Red/Yellow), the status of its associated pool, the health of individual pool members, and which iRules are currently attached<sup>45</sup>. This view is superior to the standard "Virtual Server List" for troubleshooting because it maps the dependencies between objects<sup>46</sup>. For example, if a Virtual Server is "Red," the Network Map will show if that status is inherited from a failed pool or a specific monitor failing on a pool member.

Reviewing these basic stats in the Network Map helps the administrator quickly isolate whether a failure is at the service level (Virtual Server), the logic level (iRule), or the hardware level (Pool Member).

### NEW QUESTION # 34

A Standard Virtual Server for a web application is configured with Automap for the Source Address Translation option. The original source address of the client must be known by the backend servers. What should the BIG-IP Administrator configure to meet this requirement?

- A. An HTTP Transparent profile
- B. A SNAT Pool with the client IP
- **C. An HTTP profile to insert the X-Forward-For header**
- D. The Virtual Server type as Performance (HTTP)

**Answer: C**

Explanation:

In complex network environments, "SNAT Automap" is frequently used to ensure that backend servers send return traffic through the BIG-IP. However, SNAT hides the original client's IP address, replacing it with the BIG-IP's self-IP. When interpreting traffic flow for security or logging purposes, backend servers often need that original IP. To resolve this without breaking the network-layer routing provided by SNAT, the administrator should apply an HTTP profile to the virtual server and enable the "Insert X-Forwarded-For" option. When this is enabled, the BIG-IP inserts a standard HTTP header containing the client's original IP address before forwarding the request to the pool member. This troubleshooting method allows the backend application to log the actual user's identity while maintaining a functional L3/L4 traffic flow where the server responds to the BIG-IP's local address. This is a standard troubleshooting solution for "web server not working as expected" scenarios where application logic depends on knowing the geography or specific identity of the connecting user.

## NEW QUESTION # 35

.....

RealValidExam releases 100% pass-rate F5 F5CAB5 study guide files which guarantee candidates 100% pass exam in the first attempt. It is time for you to choose a valid F5 F5CAB5 study guide, this will be your best method for clearing exam and obtain a certification. Good F5CAB5 Study Guide will be a shortcut for you to well-directed prepare and practice efficiently, you will avoid do much useless efforts and do something interesting.
