## CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions

## (Q195-Q200):

### NEW QUESTION # 195

CrowdStrike Falcon provides a one-click sensor deployment feature to streamline security operations.

Which of the following best describes the primary purpose and requirements of this feature?

- A. Can only be used with on-premises environments and is not applicable to cloud-native infrastructure.
- **B. Allows security teams to deploy Falcon sensors automatically across cloud workloads without requiring manual intervention.**
- C. Enables administrators to deploy sensors only on Windows-based cloud workloads; Linux and macOS require manual installation.
- D. Requires users to manually configure firewall rules and endpoint security settings before initiating sensor deployment.

**Answer: B**

Explanation:

Option A: One-click sensor deployment in Falcon Cloud Security enables organizations to automate the installation of Falcon sensors across cloud environments, ensuring rapid protection without manual intervention. This feature integrates with cloud providers to allow seamless deployment.

Option B: The feature is specifically designed for cloud-native environments and supports cloud workloads, making this choice incorrect.

Option C: While some configurations may be recommended, one-click deployment does not require pre-configured firewall rules or security settings; it is designed to work with minimal manual effort.

Option D: Falcon sensors are not limited to Windows. They support Linux and macOS workloads as well, making this statement misleading.

### NEW QUESTION # 196

After deploying the CrowdStrike Kubernetes Sensor in a Kubernetes cluster, some containers are not being monitored, even though the deployment logs indicate a successful installation.

What is the most likely cause of this issue?

- **A. The sensor DaemonSet is not running on all cluster nodes.**
- B. The cluster's kubelet is misconfigured, preventing the sensor from attaching to containers.
- C. The Kubernetes cluster uses a container runtime not supported by CrowdStrike.
- D. The Kubernetes cluster is running on an unsupported cloud provider.

**Answer: A**

Explanation:

Option A: While a mismatched container runtime can cause monitoring issues, CrowdStrike supports a wide range of container runtimes. If an unsupported runtime were the issue, it would be flagged during deployment, not afterward.

Option B: While kubelet misconfiguration could cause container management issues, this would typically prevent container creation or result in broader cluster-wide errors, not selective monitoring failures.

Option C: CrowdStrike supports most major cloud providers. Unsupported cloud providers would likely cause deployment issues, not selective monitoring problems.

Option D: This is the correct answer because the DaemonSet ensures that the CrowdStrike sensor runs on all nodes in the cluster. If the DaemonSet is not deployed properly across all nodes, workloads on the unaffected nodes will not be monitored, even though the overall installation appears successful.

### NEW QUESTION # 197

A security administrator is configuring pre-runtime protection in CrowdStrike Falcon to ensure that only trusted container images from specific registries are scanned and allowed for deployment.

What is the best approach for adding registry connection details?

- A. Set up registry connections using only the default Falcon registry settings without modifications.
- B. Disable scanning for images from private repositories since they are already trusted and internally managed.
- **C. Specify the registry URL, enable authentication if required, and configure scanning policies for approved images.**
- D. Add all public and private container registries without authentication to ensure maximum compatibility.

**Answer: C**

Explanation:

Option A: Default Falcon registry settings may not cover all organizational needs. Custom configurations should be made to ensure alignment with security policies.

Option B: Allowing all registries without authentication increases security risks, as unauthorized or malicious images can be pulled and deployed.

Option C: To ensure pre-runtime protection, administrators should define registry connection details, specify the registry URL, enable authentication (if needed), and set image scanning policies for security compliance.

Option D: Private repositories are not automatically secure. Vulnerabilities can still exist in private images, making it critical to enable scanning even for internal sources.

#### **NEW QUESTION # 198**

During the registration of a cloud account into the CrowdStrike Falcon platform, a user encounters an error message indicating "Insufficient permissions to access cloud resources." Which of the following actions should the user take to resolve the issue?

- A. Use the CrowdStrike service account credentials directly to bypass IAM role issues.
- B. Disable multi-factor authentication (MFA) for the cloud account temporarily.
- C. Ensure that the cloud account is part of an active CrowdStrike subscription.
- **D. Assign the CrowdStrike IAM role to the cloud account with all necessary permissions.**

**Answer: D**

Explanation:

Option A: While an active subscription is required for integration, it is unrelated to the permissions issue. A subscription mismatch would generate a different error message.

Option B: This is incorrect because MFA is unrelated to the permissions required for integration.

Disabling MFA would compromise security and would not address the root cause of insufficient permissions.

Option C: The most common cause of this error is that the necessary IAM role has not been properly assigned or lacks permissions to access the required cloud resources. The CrowdStrike documentation specifies the IAM policies required for integration, and ensuring these are correctly configured resolves the issue.

Option D: This is incorrect because CrowdStrike never recommends using service account credentials directly for security reasons. The integration relies on IAM roles for secure delegation of access.

#### **NEW QUESTION # 199**

You are configuring the CrowdStrike Falcon sensor on a Linux server. Which of the following is a requirement for the sensor to function properly?

- A. Install third-party endpoint security software alongside the Falcon sensor for comprehensive protection.
- **B. Ensure the Linux server has outbound HTTPS connectivity to CrowdStrike cloud endpoints.**
- C. Configure the Linux server to use a static IP address.
- D. Install Kubernetes tools like kubectl on the Linux server.

**Answer: B**

Explanation:

Option A: Tools like kubectl are not required for the Falcon sensor to function. These are administrative tools for managing Kubernetes clusters and do not impact the sensor's operation.

Option B: A static IP address is not required for the Falcon sensor. The sensor identifies devices using unique identifiers rather than relying on network configurations.

Option C: Installing third-party endpoint security software can cause conflicts with the Falcon sensor. CrowdStrike provides comprehensive protection, eliminating the need for additional endpoint security solutions.

Option D: The Falcon sensor requires outbound HTTPS connectivity to communicate with CrowdStrike's cloud infrastructure. This connection allows the sensor to receive updates and send telemetry data.

Without this, the sensor cannot function effectively.
