2026 Authoritative AZ-800 Reliable Dumps Ppt | 100% Free Valid AZ-800 Exam Tips

First and foremost, our company has prepared AZ-800 free demo in this website for our customers. Second, it is convenient for you to read and make notes with our PDF version of our AZ-800 learning guide. Last but not least, we will provide considerate on line after sale service for you in twenty four hours a day, seven days a week. So let our AZ-800 practice materials to be your learning partner in the course of preparing for the exam, especially the PDF version is really a wise choice for you.

Microsoft AZ-800 certification exam is designed to test your skills and knowledge in administering Windows Server Hybrid Core Infrastructure. Administering Windows Server Hybrid Core Infrastructure certification is intended for IT professionals who are

responsible for managing and maintaining hybrid environments that include both on-premises and cloud-based components. AZ-800 exam will measure your ability to deploy, manage, and monitor hybrid infrastructure, as well as your understanding of key concepts related to hybrid cloud computing.

Earning the Microsoft AZ-800 Certification demonstrates to employers that an IT professional has the skills and knowledge necessary to manage and administer hybrid environments that are becoming increasingly common in today's IT landscape. Administering Windows Server Hybrid Core Infrastructure certification is also a valuable asset for those who want to advance their careers and take on more challenging roles in IT infrastructure management.

Microsoft Administering Windows Server Hybrid Core Infrastructure Sample Questions (Q245-Q250):

NEW QUESTION # 245

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your network contains an Active Directory Domain Services (AD DS) forest. The forest contains three Active Directory sites named Site1, Site2, and Site3. Each site contains two domain controllers. The sites are connected by using DEFAULTSITELINK.

You open a new branch office that contains only client computers.

You need to ensure that the client computers in the new office are primarily authenticated by the domain controllers in Site1.

Solution: You create a new site named Site4 and associate Site4 to DEFAULTSITELINK.

Does this meet the goal?

- A. No
- B. Yes

Answer: A

Explanation:

In the AD DS Sites and Services guidance from Administering Windows Server Hybrid Core Infrastructure, Microsoft explains that client computers choose domain controllers based on site association and site-link costs: "Client computers authenticate to domain controllers in their own site. If a site contains no domain controllers, clients will select a domain controller in the closest site as determined by site link costs." The same guidance notes: "DEFAULTSITELINK assigns the same cost to all sites, so there is no preference among sites unless you create additional site links or change costs." Creating a new site (Site4) and simply associating it to DEFAULTSITELINK does not map the new branch subnet to Site1 nor does it create a lower-cost path to Site1. As a result, branch clients in Site4 (which has no DCs) could be authenticated by any site on the equal-cost default link (Site1, Site2, or Site3). The least-change configuration that meets the goal is to associate the branch subnet with a site and create/adjust site links so that Site4 # Site1 has a lower cost than to other sites (or link Site4 only to Site1). Therefore, the proposed action does not ensure that clients are primarily authenticated by Site1.

NEW QUESTION # 246

You have an Azure Active Directory Domain Services (Azure AD DS) domain named contoso.com.

You need to provide an administrator with the ability to manage Group Policy Objects (GPOs). The solution must use the principle of least privilege.

To which group should you add the administrator?

- A. Domain Admins
- B. AAD DC Administrators
- C. Group Policy Creator Owners
- D. Enterprise Admins
- E. Schema Admins

Answer: A

Explanation:

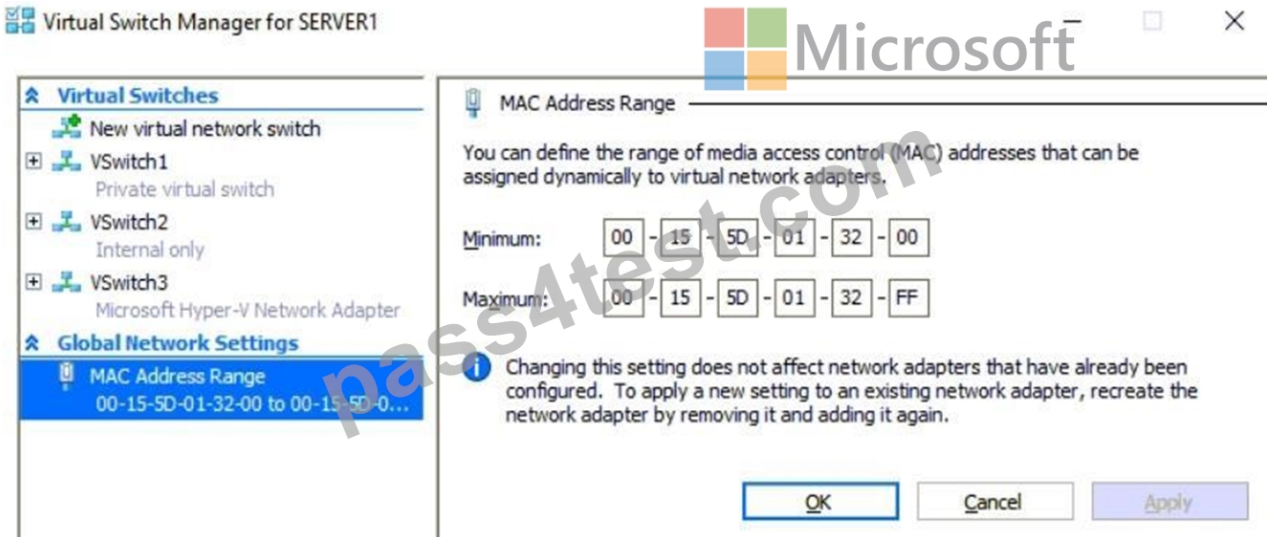

Only the Domain Admins group and the Enterprise Admins group can fully manage GPOs. Members of the Group Policy Creator Owners group can create new GPOs but they can't link the GPOs to sites, the domain or OUs and they cannot manage existing

GPOs.

NEW QUESTION # 247

Hotspot Question

You have a server named Server1 that runs Windows Server. Server1 has a single network interface and the Hyper-V virtual switches shown in the following exhibit.

Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.

NOTE: Each correct selection is worth one point.

Answer Area

On Server1, you can create additional [answer choice].

- internal virtual switches only
- private virtual switches only
- private and internal virtual switches only
- private, internal, and external virtual switches

Server1 can access network shares on virtual machines that are connected to [answer choice].

- VSwitch2 only
- VSwitch3 only
- VSwitch1 or VSwitch2 only
- VSwitch2 or VSwitch3 only
- VSwitch1, VSwitch2, or VSwitch3

Answer:

Explanation:

Answer Area

On Server1, you can create additional [answer choice].

- internal virtual switches only
- private virtual switches only
- private and internal virtual switches only
- private, internal, and external virtual switches

Server1 can access network shares on virtual machines that are connected to [answer choice].

- VSwitch2 only
- VSwitch3 only
- VSwitch1 or VSwitch2 only
- VSwitch2 or VSwitch3 only
- VSwitch1, VSwitch2, or VSwitch3

NEW QUESTION # 248

Your network contains an on-premises Active Directory Domain Services (AD DS) domain named contoso.com. The domain contains three servers that run Windows Server and have the Hyper-V server role installed. Each server has a Switch Embedded Teaming (SET) team.

You need to verify that Remote Direct Memory Access (RDMA) and required Windows Server settings are configured properly on each server to support a failover cluster.

What should you use?

- A. Failover Cluster Manager
- B. the Get-NetAdapter cmdlet
- C. the validate-DCB cmdlet
- D. Server Manager

Answer: C

NEW QUESTION # 249

You have an on-premises Active Directory Domain Services (AD DS) domain that syncs with an Azure Active Directory (Azure AD) tenant. You have an on-premises web app named WebApp1 that only supports Kerberos authentication.

You need to ensure that users can access WebApp1 by using their Azure AD account. The solution must minimize administrative effort.

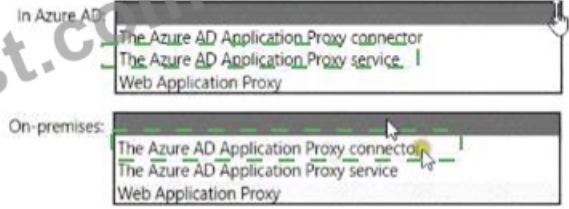

What should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.
