

NCP-BC-7.5 Exam Vce Format | Definitely Pass | Refund Gurarnteed

Prepare for the Nutanix NCP-BC-7.5 exam with ease using Test4Engine Nutanix NCP-BC-7.5 exam questions in a convenient PDF format. Our PDF files can be easily downloaded and accessed on various devices, including PCs, laptops, Macs, tablets, and smartphones. With the Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 (NCP-BC-7.5) PDF questions, you have the flexibility to study anytime and anywhere, eliminating the need for additional classes. Our comprehensive PDF guide contains all the essential information required to pass the NCP-BC-7.5 in one shot.

All-in-One Exam Guide Practice To your NCP-BC-7.5 Exam. To meet this objective Test4Engine is offering valid, updated, and real NCP-BC-7.5 exam practice test questions in their formats.. Download NCP-BC-7.5 study guide pdf, pass Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 exam with full refund guarantee! Success Nutanix exam with NCP-BC-7.5 Exam Questions which has high pass rate. Use free NCP-BC-7.5 certification questions to gain a good test result.

Valid Dumps NCP-BC-7.5 Sheet, NCP-BC-7.5 Latest Exam Guide

Nowadays in this information-based world the definition of the talents has changed a lot and the talents mean that the personnel boost both the knowledge in NCP-BC-7.5 area and the practical abilities now. With our NCP-BC-7.5 exam braindumps, you can get what you want. Our NCP-BC-7.5 Study Materials are easy to be mastered and boost varied functions. We compile Our NCP-BC-7.5 preparation questions elaborately and provide the wonderful service to you thus you can get a good learning and preparation for the exam.

Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 Sample Questions (Q82-Q87):

NEW QUESTION # 82

In the case of a protection domain containing more than 500 VMs, what is the first step an engineer must take before migrating to Prism Central-based protection policies while ensuring all VMs remain protected?

- A. Suspend the execution of protection domains during migration process.
- B. Deploy the NGT bulk installation script on all VMs in the Protection Domain.
- C. Split the existing Protection Domain into multiple smaller Protection Domains.
- D. Unprotecting certain virtual machines to meet maximum quantity requirements.

Answer: C

Explanation:

Migrating from legacy Protection Domains to modern Prism Central Protection Policies is a recommended practice for scaling DR management. However, large environments must account for architectural limits during this transition. A Nutanix cluster has specific maximum thresholds for the number of entities (VMs) that can be contained within a single Protection Domain, and similar limits exist

for the initial "handoff" to Prism Central.

If a single legacy Protection Domain contains more than 500 VMs, attempting to migrate it as a single unit can lead to timeouts, metadata synchronization failures, and potential gaps in protection. To ensure that all VMs remain consistently protected during the migration, the first step is to "split" the existing large Protection Domain into multiple smaller, more manageable ones. For example, an administrator might split a 600-VM domain into three 200-VM domains. This reduction in "entity density" allows the Nutanix Cerebro and Prism Central services to process the migration tasks more efficiently without hitting resource contention or task timeout limits. Once the VMs are organized into these smaller groups, they can be systematically unlinked from the legacy domains and added to the new PC-based Protection Policies. This phased and controlled approach minimizes risk and ensures that a valid recovery point always exists for every VM throughout the entire migration lifecycle.

NEW QUESTION # 83

A Protection Domain exists with a VM, but no new snapshots are being created and replication never starts. Which is the most likely DR setup issue?

- A. The Protection Domain has no schedule configured
- B. Bandwidth throttling is set too low
- C. The Protection Domain has no entities that are protected
- D. The remote site has no vStore mapping

Answer: A

Explanation:

In a Nutanix legacy Protection Domain (PD) configuration, three primary elements must be in place for data protection to occur: the entities (VMs), the remote site (destination), and the schedule. Even if a VM has been added to a Protection Domain (negating Option A), the cluster will not take any action unless it is explicitly told "when" and "how often" to do so.

If no new snapshots are being created locally and replication is not starting, the most likely issue is that no "Schedule" has been configured for that Protection Domain. The schedule defines the RPO (e.g., hourly, daily) and the retention period for the snapshots. Without an active schedule, the Cerebro service simply has no instruction to initiate the snapshot process. While a missing vStore mapping (Option C) would cause the "replication" to fail, the "local snapshots" would still be created in the PD. Similarly, low bandwidth throttling (Option D) would cause the replication to move slowly or time out, but it would not prevent the initial creation of the local recovery points. Therefore, verifying the presence of a valid, active replication schedule is the mandatory first step for an administrator when a Protection Domain appears to be "idle" despite having VMs assigned to it.

NEW QUESTION # 84

An administrator is concerned about the operational overhead of manually creating and managing categories across both the primary and recovery sites to ensure Recovery Plans function correctly during failover and failback. What Nutanix Disaster Recovery behavior minimizes this concern?

- A. Categories are automatically synchronized to the recovery site AZ when they are specified in a Recovery Plan.
- B. Recovery Plans replicate categories only during an active failover event to minimize replication traffic.
- C. Categories only need to be configured at the recovery site since that is where failover operations are executed.
- D. Categories must be manually replicated using the Prism Central API between sites to ensure consistency.

Answer: A

Explanation:

Nutanix Disaster Recovery (formerly known as Leap) utilizes Prism Central-based "Categories" to group virtual machines for protection. These categories are used within Protection Policies to determine replication schedules and within Recovery Plans to determine power-on sequences and network mappings. A common operational concern is the need to manually replicate these category definitions across different availability zones (AZs).

To reduce this operational overhead, Nutanix has implemented an automatic synchronization mechanism.

When an administrator creates a Recovery Plan in Prism Central and specifies certain categories for failover, the system automatically synchronizes the definition and metadata of those categories to the paired recovery AZ. This ensures that if the primary Prism Central instance becomes unavailable, the recovery site already possesses the necessary grouping logic to identify and recover the correct virtual machines. This "policy-driven" approach ensures consistency across sites and eliminates the risk of human error associated with manual configuration (Option B). By automating the lifecycle of categories between paired sites, Nutanix ensures that the disaster recovery environment is always aligned with the production environment, allowing for seamless failover and failback operations without the need for repetitive administrative tasks.

NEW QUESTION # 85

An administrator builds a single recovery plan that includes workloads protected with Asynchronous (async) and Nearsync replication schedules together with workloads protected by Synchronous replication (syncrep) schedules. Which statement is true regarding this configuration?

- A. Mixing async and syncrep schedules in one recovery plan is supported.
- B. Mixing is supported only for test failovers, but not for planned or unplanned failovers.
- C. Mixing schedule types in the recovery plan only affects retention, not recovery success.
- **D. Mixing async and nearsync in the same recovery plan is supported.**

Answer: D

Explanation:

Nutanix Recovery Plans are designed to orchestrate the failover of complex applications that may consist of multiple virtual machines with different protection requirements. However, there are rules regarding which types of replication schedules can be mixed within a single plan.

Nutanix supports mixing Asynchronous and NearSync replication schedules within the same Recovery Plan.

This is because both Async and NearSync are fundamentally snapshot-based, "passive" recovery models where the system pulls from recovery points stored at the destination cluster. However, the system generally restricts or warns against mixing Synchronous replication with other types in a single orchestrated plan.

Synchronous replication (syncrep) is an "active-active" or "stretched" model that behaves differently during a failover compared to snapshot-based models. In some software versions, including entities protected by synchronous schedules with those on async/nearsync within a single plan can cause the failover task to fail validation because the orchestration logic for zero-RPO failover is distinct from snapshot restoration.

Therefore, while mixing Async and NearSync is a supported and common practice, administrators must be cautious with Synchronous workloads.

NEW QUESTION # 86

An administrator is creating a recovery plan between two availability zones. The production VMs use a subnet that does not exist at the recovery AZ. To ensure the VMs can successfully connect after a failover, what must be configured?

- **A. Network mappings to a valid subnet in the recovery plan**
- B. A local-only schedule in the protection policy
- C. A new protection policy with synchronous replication
- D. A required matching subnet name at the recovery AZ

Answer: A

Explanation:

When failing over a virtual machine between different physical locations or availability zones, it is common for the network topology at the recovery site to differ from the primary site. If a VM is recovered into a site where its original subnet is unavailable, it will lose connectivity.

To resolve this, Nutanix Recovery Plans include a "Network Mapping" section. The administrator must configure these mappings to explicitly define which production subnet at the source site corresponds to which valid subnet at the recovery site. During the failover process, the orchestrator uses this mapping to automatically re-configure the VM's virtual network interface (vNIC) to connect to the correct local VLAN or overlay network at the destination. While "matching subnet names" (Option D) can simplify management, it is not a requirement if the mapping is correctly defined. Synchronous replication (Option B) does not address the networking layer, as it is a storage-level feature. Network mapping is therefore the essential task for ensuring that workloads are not only recovered but also accessible following a failover.

NEW QUESTION # 87

.....

Provided you get the certificate this time with our NCP-BC-7.5 practice materials, you may have striving and excellent friends and promising colleagues just like you. It is also as obvious magnifications of your major ability of profession, so NCP-BC-7.5 practice materials may bring underlying influences with positive effects. The promotion or acceptance will be easy. So it is quite rewarding investment.

Valid Dumps NCP-BC-7.5 Sheet: https://www.test4engine.com/NCP-BC-7.5_exam-latest-braindumps.html

Nutanix NCP-BC-7.5 Exam Vce Format It will also enable you to make a decision based on your own needs, All Test4Engine Valid Dumps NCP-BC-7.5 Sheet Content, Product, and Materials are not sponsored by, endorsed by, and affiliated, implied or otherwise, with any other company except those partnerships explicitly announced at Test4Engine Valid Dumps NCP-BC-7.5 Sheet.com Trademarks: All registered trademarks, logos or service marks, mentioned within this document, Test4Engine Valid Dumps NCP-BC-7.5 Sheet website, products, demos, or content are trademarks of their respective owners, As long as you spare one or two hours a day to study with our latest NCP-BC-7.5 quiz prep, we assure that you will have a good command of the relevant knowledge before taking the exam.

Each of them is based on the real exam materials Valid Dumps NCP-BC-7.5 Sheet with guaranteed accuracy, One IT intern faced the horrifying utility closet that put all others to shame: A closet NCP-BC-7.5 full of random IT supplies that had not been touched in nearly fifteen years.

Authoritative Nutanix Exam Vce Format – High Hit Rate Valid Dumps NCP-BC-7.5 Sheet
