Our company enjoys good reputation in the field of providing certificate exam materials. We are dedicated to providing good and efficient Identity-and- Access-Management-Architect study guide for candidates. You can pass the exam by using the Identity-and-Access-Management-Architect questions and answers of us, therefore we are pass guarantee. If you fail to pass the exam, we will money back guarantee, and the money will return to your payment account. We are confident with our Identity-and-Access-Management-Architect Study Guide, you can trust us.

Salesforce Identity-and-Access-Management-Architect (Salesforce Certified Identity and Access Management Architect) Exam is a certification exam designed for individuals who have expertise in designing and implementing identity and access management solutions using Salesforce technologies. Identity-and-Access-Management-Architect exam is aimed at architects, engineers, and developers who have experience in designing, building, and deploying solutions to manage user authentication, authorization, and identity federation in complex Salesforce environments. Salesforce Certified Identity and Access Management Architect certification validates the skills and knowledge required to implement and manage a secure and efficient identity and access management strategy.

Identity-and-Access-Management-Architect Valid Exam Pass4sure - Identity-and-Access-Management-Architect Exam Practice

Each of the VCEPrep Salesforce Identity-and-Access-Management-Architect exam dumps formats excels in its way and carries actual Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) exam questions for optimal preparation. All of these Salesforce Certified Identity and Access Management Architect (Identity-and-Access-Management-Architect) practice question formats are easy to use and extremely convenient such that even newbies find them simple.

Salesforce Certified Identity and Access Management Architect exam is a proctored exam that consists of 60 multiple-choice questions. The test-taker has two hours to complete the exam and must score 63% or higher to pass. Identity-and-Access-Management-Architect exam can be taken online or at a proctored testing center. The cost of the exam is \$400, and candidates can take the exam up to ten times in a year.

The Salesforce Identity-and-Access-Management-Architect Exam consists of multiple-choice questions and is timed at 105 minutes. To pass the exam, candidates must score at least 67%. It is recommended that candidates have at least three to five years of experience in the field of IAM architecture before attempting the certification exam.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q105-Q110):

NEW QUESTION # 105

Universal Containers (UC) uses an internal company portal for their employees to collaborate. UC decides to use Salesforce ideas and provide the ability for employees to post ideas from the company portal. They use SAML-BASED SSO to get into the company portal and would like to leverage it to access Salesforce. Most of the users don't exist in Salesforce and they would like the user records created in Salesforce communities the first time they try to access Salesforce. What recommendation should an architect make to meet this requirement?

- A. Use Identity connect to sync users
- **B. Use just-in-time provisioning**
- C. Use on-the-fly provisioning
- D. Use Salesforce APIs to create users on the fly

Answer: B

NEW QUESTION # 106

Universal Containers (UC) has a custom, internal-only, mobile billing application for users who are commonly out of the office. The app is configured as a connected App in Salesforce. Due to the nature of this app, UC would like to take the appropriate measures to properly secure access to the app. Which two are recommendations to make the UC? Choose 2 answers

- **A. Use Google Authenticator as an additional part of the login process**
- **B. Require High Assurance sessions in order to use the Connected App.**
- C. Disallow the use of Single Sign-on for any users of the mobile app.
- D. Set Login IP Ranges to the internal network for all of the app users Profiles.

Answer: A,B

Explanation:

Requiring High Assurance sessions and using Google Authenticator are two ways to enhance the security of the connected app.

* Option B is correct because requiring High Assurance sessions means that the users must verify their identity using a second factor, such as a verification code or biometric scan, before they can access the connected app.

* Option D is correct because using Google Authenticator as an additional part of the login process also adds a second factor of authentication, which can be generated by the Google Authenticator app on the user's mobile device.

* Option A is incorrect because disallowing the use of Single Sign-on for any users of the mobile app does not improve the security of the app, and may create more inconvenience for the users who have to remember multiple credentials.

* Option C is incorrect because setting Login IP Ranges to the internal network for all of the app users Profiles does not work for users who are commonly out of the office, as they may need to access the app from different locations.

NEW QUESTION # 107

Universal Containers (UC) is setting up delegated authentication to allow employees to log in using their corporate credentials. UC's security team is concerned about the risks of exposing the corporate login service on the internet and has asked that a reliable trust mechanism be put in place between the login service and Salesforce.

What mechanism should an Architect put in place to enable a trusted connection between the login service and Salesforce?

- A. Require the use of Salesforce security tokens on passwords.
- B. Set up a proxy service for the login service in the DMZ.
- C. Include Client Id and Client Secret in the login header callout.
- **D. Enforce mutual authentication between systems using SSL.**

Answer: D

Explanation:

Explanation

To enable a trusted connection between the login service and Salesforce, an architect should enforce mutual authentication between systems using SSL. Mutual authentication, also known as two-way SSL or client certificate authentication, is a process in which both parties in a communication exchange certificates to verify their identities⁷. This mechanism ensures that only authorized systems can access each other's resources and prevents unauthorized access or spoofing attacks⁸. To use mutual authentication with delegated authentication, you need to do the following steps⁹:

Generate a self-signed certificate in Salesforce and download it.

Import the certificate into your login service's truststore.

Configure your login service to require client certificates for incoming requests.
Generate a certificate for your login service and export it.
Import the certificate into Salesforce's certificate and key management tool.
Enable mutual authentication for your login service's endpoint URL in Salesforce.

NEW QUESTION # 108

Universal containers (UC) employees have Salesforce access from restricted IP ranges only, to protect against unauthorized access. UC wants to rollout the Salesforce1 mobile app and make it accessible from any location. Which two options should an architect recommend? Choose 2 answers

- A. Relax the IP restriction with a second factor in the connect app settings for Salesforce1 mobile app
- B. Remove existing restrictions on IP ranges for all types of user access.
- C. Use login flow to bypass IP range restriction for the mobile app.
- D. Relax the IP restriction in the connect app settings for the Salesforce1 mobile app

Answer: A,D

Explanation:

Relaxing the IP restriction in the connected app settings for the Salesforce1 mobile app and relaxing the IP restriction with a second factor in the connected app settings for Salesforce1 mobile app are two options that an architect should recommend. These options allow UC employees to access the Salesforce1 mobile app from any location, while still maintaining some level of security. Relaxing the IP restriction means that users can log in to the connected app from outside the trusted IP ranges defined in their profiles¹. Adding a second factor means that users need to provide an additional verification method, such as a verification code or a security key, to access the app². Using a login flow to bypass IP range restriction for the mobile app is not a recommended option because it can create a complex and inconsistent user experience³. Removing existing restrictions on IP ranges for all types of user access is not a recommended option because it can expose UC's data and applications to unauthorized access⁴. References: 1: Restrict Access to Trusted IP Ranges for a Connected App 2: Require Multi-Factor Authentication for Connected Apps 3: [Custom Login Flows] 4: [Restrict Login Access by IP Address]

NEW QUESTION # 109

Universal Containers wants Salesforce inbound OAuth-enabled integration clients to use SAML-BASED single Sign-on for authentication. What OAuth flow would be recommended in this scenario?

- A. SAML assertion OAuth flow
- B. User-Token OAuth flow
- C. Web server OAuth flow
- D. User-Agent OAuth flow

Answer: A
