### Cisco Certified Support Technician (CCST) Cybersecurity Sample Questions (Q316-Q321):

#### NEW QUESTION # 316

Which of the following describes the purpose of a VPN (Virtual Private Network)?

- A. To improve network performance and reduce latency
- B. To provide secure remote access to a private network over the internet
- C. To control and filter network traffic based on predefined policies
- D. To segment a network into multiple smaller networks

**Answer: B**

Explanation:

A VPN (Virtual Private Network) is a technology that enables secure and encrypted communication over a public network, such as the internet. It allows users to establish a secure connection to a private network from remote locations. By encrypting the communication, a VPN ensures confidentiality and integrity of the data transmitted between the remote user and the private network, making it a suitable solution for secure remote access.

#### NEW QUESTION # 317

You are going to perform a penetration test on a company LAN. As part of your preparation, you access the company's websites, view webpage source code, and run internet searches to uncover domain information. You also use social media to gather details about the company and its employees.

Which type of reconnaissance activities are you performing?

- A. Invasive
- B. Passive
- C. Offline
- D. Active

**Answer: B**

Explanation:

The CCST Cybersecurity Study Guide explains that reconnaissance is the process of collecting information about a target before attempting exploitation.

"Passive reconnaissance is conducted without directly engaging with the target systems. Examples include reviewing public websites, examining HTML source code, querying public DNS records, and using social media to gather information. Since no packets are sent directly to the target system, it reduces the risk of detection." (CCST Cybersecurity, Vulnerability Assessment and Risk Management, Reconnaissance Techniques section, Cisco Networking Academy) Passive (A) is correct because all actions described - viewing public pages, searching online, and checking social media - involve no direct interaction that could alert the target.

Active (B) would involve direct probing, like port scans or vulnerability scans.

Offline (C) is not an official reconnaissance classification in this context.

Invasive (D) is a general term and not used as a standard reconnaissance category in CCST material.

#### NEW QUESTION # 318

Which of the following is not a component of risk management?

- A. Risk elimination.
- B. Risk assessment.
- C. Risk monitoring.
- D. Risk identification.

**Answer: A**

Explanation:

Risk elimination is not a component of risk management. Risk management involves identifying, assessing, and mitigating risks, as well as monitoring and reviewing the effectiveness of risk controls. While it is ideal to eliminate risks entirely, it is not always feasible, and the focus is often on minimizing or mitigating risks rather than eliminating them completely.

#### NEW QUESTION # 319

Which notation is used by IPv6?

- A. Octal notation
- B. Decimal notation
- C. Hexadecimal notation
- D. Binary notation

**Answer: C**

Explanation:

IPv6 addresses are expressed using hexadecimal notation. It consists of eight groups of four hexadecimal digits separated by colons, e.g., 2001:0db8:85a3:0000:0000:8a2e:0370:7334. Hexadecimal digits range from 0 to 9 and A to F.

#### NEW QUESTION # 320

Which of the following is a best practice for implementing strong password policies within an organization?

- A. Requiring users to change their password every 90 days
- B. Allowing users to reuse their previous passwords
- C. Allowing users to choose their own passwords, regardless of complexity
- D. Storing passwords in clear text in a central database

**Answer: A**

Explanation:

Option 1: Incorrect. Allowing users to choose their own passwords, regardless of complexity, can lead to weak passwords that are easily guessed or cracked.

Option 2: Correct. Requiring users to change their password every 90 days helps to ensure that passwords are regularly updated and less likely to be compromised.

Option 3: Incorrect. Storing passwords in clear text in a central database is a security risk as it exposes the passwords to potential unauthorized access.

Option 4: Incorrect.

Allowing users to reuse their previous passwords increases the risk of unauthorized access as attackers may already be aware of the user's previous passwords.
