Purchase TrainingDump best Mule-Dev-202 study material today and get these stunning offers.

Salesforce Certified MuleSoft Hyperautomation Developer Sample Questions (Q12-Q17):

NEW QUESTION # 12

A Salesforce admin for AnyAirlines constructs a MuleSoft Composer flow that retrieves a record based on a unique ID using the Get Records action from a Salesforce connector. They will use the result to send a Slack message. How can they achieve this task?

- A. 1. Add a For Each loop after the Salesforce action step iterating over the collection of Salesforce records.2. Use a Slack action step to construct the messages from the record being processed.
- B. 1. Add an If/Else Block after the Salesforce action step, which contains a branch checking if the Salesforce action step returned exactly one record.2. In the branch, add a Slack action step and use the record to construct the message.
- C. 1. Add a Slack action step after the Salesforce action step.2. Use the first record from the collection of Salesforce records to construct the message.
- **D. 1. Add a Slack action step after the Salesforce action step.2. Use the record to construct the message.**

Answer: D

Explanation:

Salesforce Action Step:Start by adding a Salesforce action step that uses the Get Records action to retrieve the record based on a unique ID. This action retrieves the specific record needed.

Reference:MuleSoft Composer Salesforce Connector

Add Slack Action Step:After retrieving the record, add a Slack action step. This step will be used to send the message to Slack.

Reference:MuleSoft Composer Slack Connector

Use the Record:Use the retrieved record directly to construct the message in the Slack action step. This ensures the message contains the relevant information from the Salesforce record.

Reference:Building Messages in Composer

No Need for Collection Handling:Since the Get Records action retrieves a single record based on a unique ID, there is no need to handle collections or iterate through records.

Reference:Get Records Action

NEW QUESTION # 13

The Ops team at AnyAirlines needs to periodically check the status of an API to see if the connected database is down for maintenance.

Where should the Ops team set up a scheduled API call and view the status history?

- A. API Manager Analytics
- B. API Monitoring Dashboard
- **C. API Functional Monitoring**
- D. API Manager Alerts

Answer: C

Explanation:

To periodically check the status of an API and see if the connected database is down for maintenance, the Ops team should use API Functional Monitoring:

API Functional Monitoring:

API Functional Monitoring allows you to set up scheduled tests and monitor the functional performance of your APIs. It can be configured to periodically make API calls and check for specific conditions, such as whether the database is down for maintenance.

Scheduled API Calls:

Set up the necessary tests within API Functional Monitoring to periodically call the API and verify its status.

These tests can be scheduled to run at regular intervals.

View Status History:

API Functional Monitoring provides a dashboard where you can view the history of these tests, including their results and any failures. This helps in tracking the availability and performance of the API over time.

MuleSoft API Functional Monitoring Documentation

NEW QUESTION # 14

Which component of Anypoint Platform is responsible for enforcing API policies?

- A. API Analytics
- B. API Runtime
- C. API Manager
- **D. API Gateway**

Answer: D

Explanation:

The component of Anypoint Platform responsible for enforcing API policies is the API Gateway.

API Gateway:

The API Gateway is a runtime component that enforces policies applied to APIs. It acts as an intermediary that manages API traffic, security, and performance by applying the policies configured in API Manager.

Policies such as rate limiting, security, transformation, and monitoring are enforced at the API Gateway to ensure that APIs are accessed securely and efficiently.

References:

Anypoint Platform API Gateway Documentation

NEW QUESTION # 15

Which API policy can be applied to limit the number of requests an individual client can make to an API?

- A. Client ID Enforcement
- **B. Rate limiting - SLA-Based**
- C. Spike Control
- D. OAuth 2.0 access token enforcement

Answer: B

Explanation:

The Rate Limiting - SLA-Based policy in Anypoint Platform is designed to control the number of requests an individual client can make to an API. This policy is highly configurable and allows you to set specific limits based on service level agreements (SLAs).

Rate Limiting - SLA-Based:

This policy helps protect APIs from being overwhelmed by too many requests by enforcing a limit on the number of requests a client can make within a specified time frame.

You can define different rate limits for different tiers of clients, ensuring fair usage and protecting backend services.

Anypoint Platform Rate Limiting Documentation

NEW QUESTION # 16

Northern Trail Outfitters is building a hyperautomation solution using Salesforce and MuleSoft. They need to use Salesforce Flow to automate a multi-departmental process in an external system and capture the outcome in Salesforce.

How should the Salesforce Flow solution be structured to meet this requirement?

- A. Parent and subflows invoked by REST API to capture user inputs and update Salesforce records
- B. An autolaunched flow invoked by REST API to update Salesforce after the process is completed
- **C. A Flow Orchestration to automate the multi-departmental process and update Salesforce records**
- D. An evaluation flow which evaluates when the process is completed and updates Salesforce records

Answer: C

Explanation:

Salesforce Flow Orchestration is designed to manage complex, multi-step business processes that span multiple departments and systems. Here's how it can be structured to meet the requirement:

Automate Multi-Departmental Process:

Use Flow Orchestration to define and manage the steps involved in the multi-departmental process. It allows you to break down the process into stages and define the sequence of actions and approvals required.

Capture Outcome in Salesforce:

After completing the external process, Flow Orchestration can be configured to update Salesforce records with the outcome. This ensures that the results of the automated process are reflected within Salesforce.

Orchestration Capabilities:

Salesforce Flow Orchestration provides features such as task assignments, decision elements, and complex branching logic, which are ideal for managing multi-departmental workflows.
