Valid ADX-350 Study Plan & Latest ADX-350 Test Camp

Our ADX-350 study materials can improve your confidence for real ADX-350 exam and will help you remember the exam questions and answers that you will take part in. You can choose the version which suits you mostly. Our ADX-350 exam torrents simplify the important information and seize the focus to make you master the ADX-350 Test Torrent in a short time. To gain a comprehensive understanding of our ADX-350 study materials, you have to look at the introduction of our product firstly if you free download the demo of our ADX-350 exam questions.

Salesforce Certified Hyperautomation Specialist Exam Sample Questions (Q18-Q23):

NEW QUESTION # 18

An RPA developer is building the implementation of an RPA process based on the BPMN created by a colleague. In the BPMN, they see the symbol below:

What does the symbol represent?

- A. A cleanup activity that is performed at the end of the process to ensure all running applications are closed
- **B. A point in the process where different activities are performed under different circumstances**
- C. One possible endpoint for the process
- D. An activity that is performed if an error occurs during processing

Answer: B

Explanation:

* Symbol Meaning: The symbol shown is a diamond with an "X" inside, which represents an exclusive gateway in BPMN (Business Process Model and Notation). This gateway is used to control the flow of the process based on certain conditions or circumstances.

* Exclusive Gateway: An exclusive gateway routes the process flow into one of several paths based on conditions defined within the process model. Only one path is taken out of the gateway.

* Usage in Process: When an exclusive gateway is encountered, the process evaluates the conditions on each outgoing sequence flow and chooses the path that meets the conditions. This ensures different activities are performed based on different circumstances.

NEW QUESTION # 19

Northern Trail Outfitters wants to run a bidirectional sync of data between two Salesforce orgs. They want to perform real-time updates between both systems so that if either system is updated, the other one is automatically updated with the new data.

What is the minimum number of MuleSoft Composer flows needed to meet this requirement?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

Explanation:

To achieve a bidirectional sync between two Salesforce orgs using MuleSoft Composer, you would need a minimum of two flows.

Flow 1: Sync from Org A to Org B: This flow monitors changes in Org A and updates Org B with the new data whenever a change occurs.

Flow 2: Sync from Org B to Org A: Similarly, this flow monitors changes in Org B and updates Org A with the new data whenever a change occurs.

This setup ensures that any change in either Salesforce org is reflected in the other, maintaining real-time synchronization between the two systems.

NEW QUESTION # 20

A MuleSoft developer at AnyAirlines is tasked with creating a new API for an integration.

According to best practices, what is the first step they need to perform?

- A. Create a new project in Anypoint Studio.
- B. Create a case in Salesforce.
- C. Install a standalone Mule runtime on their local machine.
- **D. Create a RAML definition in Design Center.**

Answer: D

Explanation:

* RAML Definition Creation: The first step in creating a new API as per MuleSoft best practices is to create a RAML (RESTful API Modeling Language) definition in the Design Center. This step is critical as it outlines the API's structure, endpoints, methods, and data types, providing a clear blueprint for subsequent development.

- * Project Creation in Anypoint Studio: Once the RAML definition is created, the next step would be to generate the API project in Anypoint Studio. This IDE allows developers to implement the API logic as defined in the RAML.
- * Mule Runtime Installation: Installing Mule runtime is necessary for running and testing Mule applications locally. However, this step is secondary to defining the API's structure.
- * Case Creation in Salesforce: Creating a case in Salesforce is not relevant to the API development process but may be necessary for support or project management purposes.

NEW QUESTION # 21

Northern Trail Outfitters wants to create an automation which runs on a fixed schedule to enter sales data into NetSuite running as a process in the background. The business product owner chose MuleSoft Composer as the tool for this task. The Salesforce admin wants to advise the product owner about how the MuleSoft Composer scheduling functionality works. Which two options are available for use as the time mechanism within MuleSoft Composer? (Choose two.)

- A. Every 30 minutes
- B. Every 5 minutes
- C. Every 30 days
- D. Schedule based on a formula

Answer: A,B

Explanation:

MuleSoft Composer provides scheduling functionality that allows you to set up automated flows to run at specified intervals. The available options for scheduling within MuleSoft Composer include:

Every 30 minutes:

This option allows you to set up a flow to run every half hour, ensuring that your automation process is executed at regular intervals throughout the day.

Every 5 minutes:

This option enables the flow to run at a higher frequency, executing the automation process every 5 minutes, which is useful for scenarios that require more frequent updates or processing.

These scheduling options ensure that you can automate tasks at the desired frequency without manual intervention.

NEW QUESTION # 22

What is the difference between Run and Debug modes in Flow Builder?

- A. Debug mode uses AI to fix any bugs in the flow.
- B. Debug mode displays details for debugging the flow.
- C. Run mode is only available for active flows.
- D. Run mode uses the latest version of the flow.

Answer: B

Explanation:

In Flow Builder, Run and Debug modes have distinct functionalities:

Run Mode:

Executes the flow as it is, allowing you to see the end-to-end execution based on the latest saved version.

Typically used to verify that the flow works as expected under normal conditions.

Debug Mode:

Provides detailed information for each step of the flow, including input and output data, and any errors encountered.

Useful for troubleshooting and identifying issues within the flow, allowing developers to understand how the flow executes and where problems may arise.

Debug mode is specifically designed to aid in diagnosing and fixing issues by providing a granular view of the flow's execution.
