Salesforce Analytics-DA-201 Sample Test Online, Analytics-DA-201 Frequent Updates

As we all know, if you want to pass the Analytics-DA-201 exam, you need to have the right method of study, plenty of preparation

time, and targeted test materials. However, most people do not have one or all of these. That is why I want to introduce our Analytics-DA-201 Original Questions to you. So why not try our Salesforce original questions, which will help you maximize your pass rate? Even if you unfortunately fail to pass the exam, we will give you a full refund.

Salesforce Analytics-DA-201 Exam Syllabus Topics:

| Topic | Details |
|---------|---|
| Topic 1 | <ul style="list-style-type: none"> ABAP Core Data Services and Data Modeling: This section of the exam measures the skills of the SAP ABAP Cloud Developer and covers the fundamental understanding of core data services (CDS) and how to design data models in the SAP ABAP environment. Candidates are expected to know how to define, consume, and optimize CDS views effectively to support application development in the cloud. |
| Topic 2 | <ul style="list-style-type: none"> ABAP SQL and Code Pushdown: This section of the exam measures the competencies of the SAP ABAP Cloud Developer related to performance optimization through ABAP SQL and code pushdown techniques. It ensures that the developer understands how to shift logic to the database layer using efficient SQL scripting to enhance performance in data-intensive applications. |
| Topic 3 | <ul style="list-style-type: none"> ABAP RESTful Application Programming Model: This section of the exam evaluates the capabilities of the SAP S 4HANA Technical Consultant in using the ABAP RESTful Application Programming Model (RAP). It focuses on understanding the structure and components of RAP, including behavior definitions, service bindings, and metadata extension. The goal is to validate the ability to develop modern and scalable applications using RAP. |

Salesforce Certified Tableau Data Analyst Sample Questions (Q62-Q67):

NEW QUESTION # 62

You have the Mowing two tables that contains data about the books in a library.

Both tables are incomplete so there are books missing from the tables.

You need to combine the tables. The solution must ensure that all the data is retained Which type of join should you use?

- A. Right join
- B. Full outer join**
- C. Inner join
- D. left join

Answer: B

Explanation:

To combine the two tables that contain data about books in a library and ensure that all the data is retained, you should use a full outer join. A full outer join is a type of join that returns all rows from both tables, regardless of whether there is a match or not. If there is no match, null values are filled in for the missing fields.

To perform a full outer join, you need to do the following steps:

* Connect to both tables as your data sources in Tableau. You can use either live or extract connections.

* Drag one table to the canvas and drop it on top of another table. This will create a join between them based on a common field.

* Click on the join icon between the tables and select Full Outer Join from the drop-down list. This will change the join type to full outer join and show all rows from both tables.

* Optionally, you can add or remove join clauses by clicking on Add or Remove buttons next to each clause. You can also change or rename fields by clicking on them.

The other types of joins are not correct for this scenario. An inner join returns only the rows that have a match in both tables, which will exclude any books that are missing from either table. A left join returns all rows from the left table and only the matching rows from the right table, which will exclude any books that are only in the right table. A right join returns all rows from the right table and only the matching rows from the left table, which will exclude any books that are only in the left table. References:

<https://help.tableau.com>

/current/pro/desktop/en-us/joining_tables.htm https://help.tableau.com/current/pro/desktop/en-us/join_types.htm

When combining two datasets that are both incomplete and where it's important to retain all data from both sources, a full outer join is appropriate. This type of join ensures that all records from both tables are included in the combined dataset, even if there are no

matching records in the other table.

NEW QUESTION # 63

The following table displays the row-level data in a Tableau data source:

| Order ID | Item | Sales |
|----------|------|-------|
| 1 | A | 20 |
| 1 | C | 10 |
| 2 | B | 15 |
| 3 | A | 40 |
| 4 | D | 30 |

A Data Analyst creates this calculated field:

$\text{SUM}(\text{IF} [\text{Item}] = 'A' \text{ THEN} [\text{Sales}] \text{ END}) / \text{COUNT}([\text{Order ID}])$

What is the result of this aggregate calculation?

- A. 0
- B. 1
- C. An error
- D. 2

Answer: D

NEW QUESTION # 64

You plan to publish a workbook to Tableau Server.

You want to ensure that users can see other published dashboards from their current dashboard.

Which setting should you configure? (Click the appropriate Option in the Answer Area.)

Answer:

Explanation:

Explanation:

To achieve the requirement of letting users navigate between different published dashboards directly from their current dashboard, you need to enable the "Show sheets as tabs" option. This setting allows each sheet in your workbook, including dashboards, to be displayed as a tab, making it easy for users to switch between different views or dashboards within the same published workbook. Here is the option you should configure:

* Check the Show sheets as tabs checkbox in the 'More Options' section.

This action will ensure that all sheets, when published to the Tableau Server, appear as tabs, facilitating user navigation across multiple dashboards included in the workbook.

NEW QUESTION # 65

You have a data source that contains data for every city in the United States. The following is a sample of the data.

| City | State | Country | Population |
|----------|------------|---------------|------------|
| Miami | Florida | United States | 454 279 |
| New York | New York | United States | 8 419 000 |
| Seattle | Washington | United States | 724 305 |
| Chicago | Illinois | United States | 2 710 000 |

You need to use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million. Which type of filter should you use?

- A. Condition filter
- B. Wildcard filter
- C. Top filter
- D. General filter

Answer: A

Explanation:

To use the City dimension to create a dynamic filter that shows the cities that have a population greater than one million, you should use a condition filter. A condition filter is a type of filter that shows only the values that meet a specified condition based on a measure or a calculation. You can create a condition filter by dragging a dimension to the Filters shelf and selecting Condition from the dialog box. Then you can enter a formula or choose an option that defines your condition.

In this case, you want to create a condition filter based on Population, which is a measure. You can drag City to the Filters shelf and select Condition from the dialog box. Then you can choose By field from the tab and select Population > Sum > Greater than > 1000000 from the drop-down lists. This will create a condition filter that shows only the cities that have a sum of population greater than one million.

The other options are not correct for this scenario. A general filter is not a specific type of filter, but a term that refers to any type of filter in Tableau. A wildcard filter is a type of filter that shows only the values that match a specified pattern or string, such as "New*"

or "*top". A top filter is a type of filter that shows only the top or bottom N values of a measure or dimension based on a ranking or an aggregation. References:

NEW QUESTION # 66

A Data Analyst at a coffee company has the following visualization already built.

□ The analyst wants to make this more visually appealing by coloring the bars based on whether they are above or below the Average Sales within each Product Type.

Which calculation should the analyst use to calculate the Average Sales for each Product Type?

- A. { EXCLUDE [Product] : SUM([Sales]) }
- B. (FIXED [Product] : AVG((FIXED [Product Type] : AVG([Sales])))
- C. : FIXED ([Product Type]) : AVG([FIXED [Product] : SUM([Sales])])
- D. { FIXED [Product Type] : AVG([Sales]) }

Answer: C

NEW QUESTION # 67

.....

ExamBoosts wants to win the trust of Salesforce Analytics-DA-201 exam candidates at any cost. To achieve this objective ExamBoosts is offering some top features with Analytics-DA-201 exam practice questions. These prominent features hold high demand and are specifically designed for quick and complete Salesforce Certified Tableau Data Analyst (Analytics-DA-201) exam questions preparation.
