NEW QUESTION # 329

A synchronous replication session was failed over due to the primary site being unavailable.

What operation can be performed on the session to maintain data protection once the primary site becomes available?

- A. Failback with Sync operation to restart replication and return production to the primary site
- B. Failback operation to restart replication in the reverse direction and continue running production from the secondary site
- C. Resume operation to restart replication in the reverse direction and continue running production from the secondary site
- D. Resume operation to restart replication and return production to the primary site

Answer: C

NEW QUESTION # 330

Which two actions are recommended according to best practices when connecting iSCSI host to a Dell Unity XT system? (Choose two.)

- A. Manually register host on storage array.
- B. Use private network for iSCSI interfaces.
- C. Use standard NIC for iSCSI.
- D. Interfaces should be on separate subnets.

Answer: B,D

Explanation:

Two actions that are recommended according to best practices when connecting iSCSI host to a Dell Unity XT system are to ensure that the interfaces are on separate subnets and to use a private network for iSCSI interfaces. These actions can improve the performance, security, and availability of the iSCSI network.

Having interfaces on separate subnets can prevent broadcast storms, reduce network congestion, and enable multipathing. Using a private network for iSCSI interfaces can isolate the iSCSI traffic from other network traffic, reduce the risk of interference or attacks, and simplify the network configuration. Manually registering host on storage array and using standard NIC for iSCSI are not recommended actions, as they can introduce errors, inefficiencies, and limitations.

- B. Port 0 of I/O module 1
- C. Fibre Channel Port 4 of SPA and SPB www*
- D. Fibre Channel Port 0 of I/O module 0

Answer: C

Explanation:

The preferred FC Port for synchronous replication for a Dell Unity XT 380 system is Fibre Channel Port 4 of SPA and SPB. This port is dedicated for synchronous replication traffic and has the highest priority and bandwidth allocation. Synchronous replication is a method of replicating data between two Dell Unity systems with zero recovery point objective (RPO). It requires a low-latency and high-bandwidth network connection between the source and destination systems.
