# Get the Latest New 312-50v13 Test Papers for Immediate Study and Instant Success

What's more, part of that NewPassLeader 312-50v13 dumps now are free: https://drive.google.com/open?id=1_5PLcDIpAomSWrtYBQzRFiTzfG8mhI-y

During these years, our PDF version of our ECCouncil 312-50v13 study engine stays true to its original purpose to pursue a higher pass rate that has never been attained in the past. And you will be content about our considerate service on our ECCouncil 312-50v13 training guide. If you have any question, you can just contact us!

Our 312-50v13 exam questions can assure you that you will pass the 312-50v13 exam as well as getting the related certification under the guidance of our 312-50v13 study materials as easy as pie. Firstly, the pass rate among our customers has reached as high as 98% to 100%, which marks the highest pass rate in the field. Secondly, you can get our 312-50v13 Practice Test only in 5 to 10 minutes after payment, which enables you to devote yourself to study as soon as possible.

312-50v13 Free Exam Questions - 312-50v13 Reliable Learning Materials

Many candidates who take the qualifying exams are not aware of our products and are not guided by our systematic guidance, and our users are much superior to them. In similar educational products, the 312-50v13 quiz guide is absolutely the most practical. Also, from an economic point of view, our Certified Ethical Hacker Exam (CEHv13) exam dumps is priced reasonable, so the 312-50v13 test material is very responsive to users, user satisfaction is also leading the same products. So economical and practical learning platform, I believe that will be able to meet the needs of users. Users can deeply depend on our Certified Ethical Hacker Exam (CEHv13) exam dumps when you want to get a qualification. There may be many problems and difficulties you will face, but believe in our Certified Ethical Hacker Exam (CEHv13) exam dumps if you want to be the next beneficiary, our 312-50v13 Quiz guide is not only superior in price than any other makers in the educational field , but also are distinctly superior in the quality of our products.

ECCouncil Certified Ethical Hacker Exam (CEHv13) Sample Questions (Q767-Q772):

NEW QUESTION # 767

During a review for DoS threats, several IP addresses generate excessive traffic. Packet inspection shows the TCP three-way handshake is never completed, leaving many connections in a SYN_RECEIVED state and consuming server resources without completing sessions. What type of DoS attack is most likely occurring?

- A. SYN Flood
- B. UDP Flood
- C. Ping of Death

- D. Smurf Attack

Answer: A

Explanation:
In the CEH Denial-of-Service and Network Attacks coverage, a SYN flood is a classic TCP-based DoS technique that exploits the TCP connection establishment process. In a normal handshake, the client sends SYN, the server replies SYN/ACK, and the client completes with ACK. A SYN flood deliberately sends a high volume of SYN packets (often spoofed) but never completes the final ACK. As CEH describes, this leaves the server holding many half-open connections in SYN_RECEIVED, consuming memory and connection table resources (backlog queue). When the backlog fills, legitimate clients cannot establish connections, degrading availability.
The indicators in your scenario align exactly with CEH's SYN flood fingerprints: incomplete handshakes and accumulation of half-open connections. The goal is resource exhaustion at the connection-management layer rather than bandwidth saturation.
Option B (Ping of Death) involves malformed/oversized ICMP packets and does not match SYN_RECEIVED behavior. Option C (UDP flood) targets UDP services/ports and creates different symptoms (high UDP traffic, ICMP unreachable messages, service degradation) without half-open TCP states. Option D (Smurf) is ICMP- based amplification via broadcast addresses-again unrelated to incomplete TCP handshakes.
CEH also notes mitigations such as SYN cookies, increasing backlog, reducing SYN-RECEIVED timers, rate limiting, and upstream filtering-further reinforcing that the described event is a SYN flood.

NEW QUESTION # 768
What type of virus is most likely to remain undetected by antivirus software?

- A. Macro virus
- B. File-extension virus
- C. Stealth virus
- D. Cavity virus

Answer: C

NEW QUESTION # 769
Which of the following tools are used for enumeration? (Choose three.)

- A. USER2SID
- B. SID2USER
- C. Cheops
- D. DumpSec
- E. SolarWinds

Answer: A,B,D

Explanation:
Enumeration is the process of extracting usernames, shares, services, and other system-specific information from a target system.
Tools used for enumeration include:
B). USER2SID: Resolves a username to its associated Security Identifier (SID).
D). SID2USER: Resolves an SID back to the corresponding username.
E). DumpSec: A powerful GUI tool used to enumerate users, shares, and permissions on Windows systems.
From CEH v13 Courseware:
Module 4: Enumeration
Section: NetBIOS and Windows Enumeration Tools
CEH v13 Study Guide states:
"USER2SID and SID2USER are classic tools used to map usernames to SIDs and vice versa during Windows enumeration.
DumpSec can enumerate user accounts, group memberships, and shared resources on systems with open permissions." Incorrect Options:
A). SolarWinds: Primarily a network performance monitoring tool, not designed for enumeration.
C). Cheops: A network mapping tool, not an enumeration utility.

NEW QUESTION # 770

What is the role of test automation in security testing?

- A. It is an option but it tends to be very expensive.
- B. It can accelerate benchmark tests and repeat them with a consistent test setup. But it cannot replace manual testing completely.
- C. Test automation is not usable in security due to the complexity of the tests.
- D. It should be used exclusively. Manual testing is outdated because of low speed and possible test setup inconsistencies.

Answer: B

Explanation:

In the context of security testing, test automation plays a critical role in improving the speed and consistency of testing activities. However, it cannot entirely replace manual testing because certain security vulnerabilities-especially logic flaws or issues with session management-often require human intuition and contextual understanding.

According to CEH v13 Official Courseware - Module 05 (Vulnerability Analysis), and confirmed in the CEH v13 Study Guide, automated testing is best suited for:

Repetitive benchmark tests

Regression testing

Scanning for known vulnerabilities

Ensuring consistency across environments

However, manual testing is still essential for:

Business logic testing

Security misconfiguration identification

Discovering zero-day flaws

NEW QUESTION # 771

An IT security team is conducting an internal review of security protocols in their organization to identify potential vulnerabilities. During their investigation, they encounter a suspicious program running on several computers. Further examination reveals that the program has been logging all user keystrokes. How can the security team confirm the type of program and what countermeasures should be taken to ensure the same attack does not occur in the future?

- A. The program is a Trojan; the tearm should regularly update antivirus software and install a reliable firewall
- B. The program is a keylogger; the team should educate employees about phishing attacks and maintain regular backups
- C. The program is a keylogger; the team should employ intrusion detection systems and regularly update the system software
- D. The program is spyware; the team should use password managers and encrypt sensitive data

Answer: C

Explanation:

A keylogger is a type of spyware that can record and steal consecutive keystrokes (and much more) that the user enters on a device. Keyloggers are a common tool for cybercriminals, who use them to capture passwords, credit card numbers, personal information, and other sensitive data. Keyloggers can be installed on a device through various methods, such as phishing emails, malicious downloads, or physical access. To confirm the type of program, the security team can use a web search tool, such as Bing, to look for keylogger programs and compare their features and behaviors with the suspicious program they encountered. Alternatively, they can use a malware analysis tool, such as Malwarebytes, to scan and identify the program and its characteristics. To prevent the same attack from occurring in the future, the security team should employ intrusion detection systems (IDS) and regularly update the system software. An IDS is a system that monitors network traffic and system activities for signs of malicious or unauthorized behavior, such as keylogger installation or communication. An IDS can alert the security team of any potential threats and help them respond accordingly. Regularly updating the system software can help patch any vulnerabilities or bugs that keyloggers may exploit to infect the device. Additionally, the security team should also remove the keylogger program from the affected computers and change any compromised passwords or credentials. References:
