CompTIA SecurityX Certification Exam Sample Questions (Q148-Q153):

NEW QUESTION # 148

A company wants to install a three-tier approach to separate the web, database, and application servers. A security administrator must harden the environment which of the following is the best solution?

- A. installing a firewall and making it the network core
- B. Implementing microsegmentation on the server VLANs
- C. Deploying a VPN to prevent remote locations from accessing server VLANs
- D. Configuring a SASb solution to restrict users to server communication

Answer: B

Explanation:

The best solution to harden a three-tier environment (web, database, and application servers) is to implement microsegmentation on the server VLANs.

Enhanced Security: Microsegmentation creates granular security zones within the data center, allowing for more precise control over east-west traffic between servers. This helps prevent lateral movement by attackers who may gain access to one part of the network.

Isolation of Tiers: By segmenting the web, database, and application servers, the organization can apply specific security policies and controls to each segment, reducing the risk of cross-tier attacks.

Compliance and Best Practices: Microsegmentation aligns with best practices for network security and helps meet compliance requirements by ensuring that sensitive data and systems are properly isolated and protected.

NEW QUESTION # 149

A company sells a security appliance assembled from globally sourced hardware and software components. Installing the security appliance requires enabling administrative permissions for the service accounts on the appliance. Which of the following allows the company to reassure new and existing customers that the risk introduced by the appliance is minimal?

- A. Results of internal risk reduction studies conducted by a third-party assessor
- B. A business impact analysis and risk prioritization process
- C. A transparent supply chain risk management and testing program
- D. The results of a qualitative risk analysis performed on the appliance

Answer: C

Explanation:

A transparent supply chain risk management and testing program gives customers visibility into how the company evaluates, tests, and secures globally sourced components. This directly reassures customers that risks from the appliance are minimized through rigorous, verifiable controls and supply chain oversight.

NEW QUESTION # 150

A security engineer receives reports through the organization's bug bounty program about remote code execution in a specific component in a custom application. Management wants to properly secure the component and proactively avoid similar issues. Which of the following is the best approach to uncover additional vulnerable paths in the application?

- A. Reverse engineer the application to look for vulnerable code paths.
- B. Leverage an exploitation framework to uncover vulnerabilities.
- **C. Use fuzz testing to uncover potential vulnerabilities in the application.**
- D. Utilize a software composition analysis tool to report known vulnerabilities.
- E. Analyze the use of an HTTP intercepting proxy to dynamically uncover issues.

Answer: C

Explanation:

Fuzz testing is a technique used to identify vulnerabilities by inputting a large volume of random, unexpected, or malformed data into the application. It helps uncover vulnerabilities like buffer overflows, input validation issues, and other security flaws that may not be immediately apparent.

By systematically testing different inputs and paths in the application, fuzz testing can identify previously undiscovered vulnerabilities and help secure the component against potential exploits.

NEW QUESTION # 151

A company implemented a NIDS and a NIPS on the most critical environments. Since this implementation, the company has been experiencing network connectivity issues. Which of the following should the security architect recommend for a new NIDS/NIPS implementation?

- A. Implementing the NIDS in the bastion host and the NIPS in the branch network router
- B. Implementing a NIDS without a NIPS to increase the detection capability
- **C. Implementing the NIDS with a port mirror in the core switch and the NIPS in the main firewall**
- D. Implementing the NIDS and the NIPS together with the main firewall

Answer: C

Explanation:

Best practice in CAS-005 network security design is to deploy:

NIDS passively via a port mirror (SPAN port) to avoid introducing latency or failure points.

NIPS inline in a strategic point, such as integrated with the main firewall, to actively block threats. This combination provides both visibility and active protection without overloading network paths.

NEW QUESTION # 152

A software company deployed a new application based on its internal code repository. Several customers are reporting anti-malware alerts on workstations used to test the application. Which of the following is the most likely cause of the alerts?

- A. Data leakage
- **B. Unsecure bundled libraries**
- C. Invalid code signing certificate
- D. Misconfigured code commit

Answer: B

Explanation:

The most likely cause of the anti-malware alerts on customer workstations is unsecure bundled libraries.

When developing and deploying new applications, it is common for developers to use third-party libraries. If these libraries are not properly vetted for security, they can introduce vulnerabilities or malicious code.

Why Unsecure Bundled Libraries?

Third-Party Risks: Using libraries that are not secure can lead to malware infections if the libraries contain malicious code or vulnerabilities.

Code Dependencies: Libraries may have dependencies that are not secure, leading to potential security risks.

Common Issue: This is a frequent issue in software development where libraries are used for convenience but not properly vetted for security.

Other options, while relevant, are less likely to cause widespread anti-malware alerts:

- A: Misconfigured code commit: Could lead to issues but less likely to trigger anti-malware alerts.
- C: Invalid code signing certificate: Would lead to trust issues but not typically anti-malware alerts.
- D: Data leakage: Relevant for privacy concerns but not directly related to anti-malware alerts.
