最新的 SAP Certified Associate C-CPI-2506 免費考試真題 (Q37-Q42):

問題 #37

Why does the API Management capability of the SAP Integration Suite require API providers?

- A. To create APIs
- **B. To incorporate APIs from source systems**
- C. To create authenticated API instances

答案: B

解題說明:

In API Management (Integration Suite):

API Providers represent backend systems (e.g., SAP S/4HANA, SuccessFactors, third-party APIs).

They are required to connect and incorporate APIs from those systems into API Management.

Once defined, API Proxies are created from API Providers to expose APIs securely.

Other options:

Authentication is handled via policies, not API Providers.

APIs are created as API Proxies, not directly by Providers.

Thus, the purpose of API Providers is to incorporate APIs from source systems.

問題 #38

You use an outbound HTTP adapter with basic authentication .In SAP Integration Suite, Monitor Integrations Manage Security, where must you set up and store a user and password?

- **A. Security Material**
- B. Keystore
- C. PGP Keys
- D. Access policies

答案: A

解題說明:

To use basic authentication for outbound HTTP connections, you must store the user and password as credentials in the security material of SAP Integration Suite. Credentials are a type of security artifact that can be used to authenticate against external systems. You can create and manage credentials in the Monitor Integrations Manage Security Security Material section of SAP Integration Suite. Reference: Setting Up Outbound HTTP Connections with Basic Authentication | SAP Help Portal, Security Artifact Renewal for HTTPS-Based Communication | SAP Help Portal

問題 #39

Which part of the proxy URL is provided by the initial configuration step of the API Management?

- A. Name of the API management
- B. Version
- **C. Virtual host**
- D. Service name

答案： C

解題說明：

To set up the API Management capability within SAP Integration Suite, you must provide a virtual host as part of the initial configuration step. The virtual host is a host alias that identifies your organization and is used as the base URL of your API proxies. For example, if your virtual host is myorg, your API proxy URL will look like this:

<https://myorg.apimanagement.hana.ondemand.com/<api-name>>. The virtual host can be changed later in the API portal settings.

問題 #40

In a Content Modifier, you want to set up a call to the message body of the previous Content Modifier. Which notation do use to implement this?

- A. S(inbody)
- B. S{body.in}
- **C. S{in body}**
- D. S[bodyin]

答案： C

解題說明：

To access the message body of the previous Content Modifier step in an integration flow, you must use the notation S{in body} in the current Content Modifier step. This notation means that you want to read the value from the in-message body of the exchange container. The exchange container is used to store additional data besides the message that is being processed by SAP Integration Suite. It has two message containers: in-message and out-message. The in-message contains the original message that was received by the integration flow, while the out-message contains the modified message that will be sent by the integration flow. Reference: Content Modifier Basics | SAP Help Portal, Exchange Container | SAP Help Portal

問題 #41

You configured a content modifier as follows: Action: Create | Name: ProductID | Source Type: XPath Source Value: //ProductID | Data Type: java.lang.string. After testing the content modifier, you receive an error message that contains the following fragment: "Java.lang.ClassNotFoundException: java.lang.string..." What caused the error message?

- A. Incorrect source value
- B. Incorrect source type
- **C. Incorrect data type**
- D. Incorrect name

答案： C

解題說明：

In SAP Cloud Integration, when defining Content Modifier properties, the Java data type names are case-sensitive.

Correct type # java.lang.String

In the configuration, java.lang.string was used (lowercase "s"), which causes a ClassNotFoundException, since Java cannot find the class.

Other options are correct in form:

Source Type = XPath # Valid.

Source Value = //ProductID # Valid XPath.

Name = ProductID # Valid.

Thus, the error occurred because of incorrect data type specification.
