Our company has realized that a really good product is not only reflected on the high quality but also the consideration service. So we not only provide all people with the SAP-C02 test training materials with high quality, but also we are willing to offer the fine service system for the customers, these guarantee the customers can get. If you decide to buy the SAP-C02 learn prep from our company, we are glad to answer your all questions about the SAP-C02 study materials. We believe that you will make the better choice for yourself by our consideration service on the SAP-C02 exam questions.

Prep4pass will be with you, and make sure you can be successful. No matter how big your IT dream it is, our Prep4pass will help you to make it come true step by step. Because Prep4pass's SAP-C02 exam certification training material is worked out by senior IT specialist team through their own exploration and continuous practice. If you still have some hesitation, you can download SAP-C02 Dumps PDF free demo and answers on probation on Prep4pass websites. I believe that it won't let you down.

## 100% Pass 2026 Amazon Trustable SAP-C02: Exam AWS Certified Solutions Architect - Professional (SAP-C02) Tests

We are stable and reliable SAP-C02 exam questions providers for persons who need them for their SAP-C02 exam. We have been staying and growing in the market for a long time, and we will be here all the time, because our excellent quality and high pass rate of SAP-C02 exam questions can meet your requirement. As for the high-effective SAP-C02 training guide, there are thousands of candidates are willing to choose our SAP-C02 study question, why don't you have a try for our SAP-C02 study materials, we will never let you down!

## Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q371-Q376):

### NEW QUESTION # 371

A software as a service (SaaS) company has developed a multi-tenant environment. The company uses Amazon DynamoDB tables that the tenants share for the storage layer. The company uses AWS Lambda functions for the application services. The company wants to offer a tiered subscription model that is based on resource consumption by each tenant. Each tenant is identified by a unique tenant ID that is sent as part of each request to the Lambda functions. The company has created an AWS Cost and Usage Report (AWS CUR) in an AWS account. The company wants to allocate the DynamoDB costs to each tenant to

match that tenant's resource consumption.

Which solution will provide a granular view of the DynamoDB cost for each tenant with the LEAST operational effort?

- A. Associate a new tag that is named tenant ID with each table in DynamoDB. Activate the tag as a cost allocation tag in the AWS Billing and Cost Management console. Deploy new Lambda function code to log the tenant ID in Amazon CloudWatch Logs. Use the AWS CUR to separate DynamoDB consumption cost for each tenant ID.
- B. Deploy a Lambda function to log the tenant ID, the size of each response, and the duration of the transaction call as custom metrics to Amazon CloudWatch Logs. Use CloudWatch Logs Insights to query the custom metrics for each tenant. Use AWS Pricing Calculator to obtain the overall DynamoDB costs and to calculate the tenant costs.
- C. **Configure the Lambda functions to log the tenant ID and the number of RCUs and WCUs consumed from DynamoDB for each transaction to Amazon CloudWatch Logs. Deploy another Lambda function to calculate the tenant costs by using the logged capacity units and the overall DynamoDB cost from the AWS Cost Explorer API. Create an Amazon EventBridge rule to invoke the calculation Lambda function on a schedule.**
- D. Create a new partition key that associates DynamoDB items with individual tenants. Deploy a Lambda function to populate the new column as part of each transaction. Deploy another Lambda function to calculate the tenant costs by using Amazon Athena to calculate the number of tenant items from DynamoDB and the overall DynamoDB cost from the AWS CUR. Create an Amazon EventBridge rule to invoke the calculation Lambda function on a schedule.

**Answer: C**

Explanation:

LEAST operational effort and fine grained approach.

<https://aws.amazon.com/blogs/apn/optimizing-cost-per-tenant-visibility-in-saas-solutions/> RCU and WCU metrics are already logged in CloudWatch.

<https://docs.aws.amazon.com/amazondynamodb/latest/developerguide/metrics-dimensions.html>

### NEW QUESTION # 372

A company is deploying a new cluster for big data analytics on AWS. The cluster will run across many Linux Amazon EC2 instances that are spread across multiple Availability Zones. All of the nodes in the cluster must have read and write access to common underlying file storage. The file storage must be highly available, must be resilient, must be compatible with the Portable Operating System Interface (POSIX), and must accommodate high levels of throughput.

Which storage solution will meet these requirements?

- A. Provision a new Amazon Elastic Block Store (Amazon EBS) volume that uses the io2 volume type. Attach the EBS volume to all of the EC2 instances in the cluster.
- B. Provision an AWS Storage Gateway file gateway NFS file share that is attached to an Amazon S3 bucket. Mount the NFS file share on each EC2 instance In the cluster.
- C. Provision a new Amazon Elastic File System (Amazon EFS) file system that uses General Purpose performance mode. Mount the EFS file system on each EC2 instance in the cluster.
- D. **Provision a new Amazon Elastic File System (Amazon EFS) file system that uses Max I/O performance mode. Mount the EFS file system on each EC2 instance in the cluster.**

**Answer: D**

### NEW QUESTION # 373

A company has several AWS Lambda functions written in Python. The functions are deployed with the .zip package deployment type. The functions use a Lambda layer that contains common libraries and packages in a .zip file. The Lambda .zip packages and the Lambda layer .zip file are stored in an Amazon S3 bucket.

The company must implement automatic scanning of the Lambda functions and the Lambda layer to identify CVEs. A subset of the Lambda functions must receive automated code scans to detect potential data leaks and other vulnerabilities. The code scans must occur only for selected Lambda functions, not all the Lambda functions.

Which combination of actions will meet these requirements? (Select THREE.)

- A. Activate Amazon Inspector. Start automated CVE scans.
- B. Use Amazon Inspector to scan the S3 bucket that contains the Lambda .zip packages and the Lambda layer .zip file for code scans.
- C. **Enable scanning in the Monitor settings of the Lambda functions that need code scans.**
- D. Tag Lambda functions that do not need code scans. In the tag, include a key of InspectorCodeExclusion and a value of LambdaCodeScanning.

- E. Activate Lambda standard scanning and Lambda code scanning in Amazon Inspector.
- F. Enable Amazon GuardDuty. Enable the Lambda Protection feature in GuardDuty.

**Answer: C,D,E**

Explanation:

The company requires two different types of security analysis: vulnerability scanning for CVEs and code- level scanning for sensitive data exposure. Amazon Inspector provides both Lambda Standard Scanning and Lambda Code Scanning. These capabilities allow Inspector to examine Lambda deployment packages and Lambda layers for software vulnerabilities, and also perform static code analysis to detect insecure coding patterns. To meet the requirement that only certain Lambda functions receive deeper code scanning, Inspector allows enabling or disabling code scanning at the individual Lambda function level through the function's Monitor settings. Inspector additionally supports resource exclusion based on tagging, allowing administrators to prevent specific Lambda functions from participating in code scans. Tag-based exclusion satisfies the requirement to scan only a subset of Lambda functions. Option B is required because enabling both Lambda standard scanning and Lambda code scanning activates the functionality necessary for CVE detection and code security analysis.

Option D is required because enabling scanning at the function level ensures that code scanning runs only for selected Lambda functions.

Option E is required because resource exclusion using tags allows the administrator to exclude non-target Lambda functions from code scanning automatically.

Options A and C do not satisfy the requirement because simply activating Amazon Inspector does not configure per-function scanning behavior, and GuardDuty Lambda Protection does not scan for CVEs or code vulnerabilities. Option F is not valid because Amazon Inspector does not perform scans directly against objects stored in Amazon S3; scanning occurs against the deployed Lambda function versions themselves.

#### **NEW QUESTION # 374**

A company's solutions architect is evaluating an AWS workload that was deployed several years ago. The application tier is stateless and runs on a single large Amazon EC2 instance that was launched from an AMI. The application stores data in a MySQL database that runs on a single EC2 instance.

The CPU utilization on the application server EC2 instance often reaches 100% and causes the application to stop responding. The company manually installs patches on the instances.

Patching has caused downtime in the past. The company needs to make the application highly available.

Which solution will meet these requirements with the LEAST development me?

- A. Move the application tier to AWS Lambda functions in the existing VPC. Create an Application Load Balancer to distribute traffic across the Lambda functions. Use Amazon GuardDuty to scan the Lambda functions. Migrate the database to Amazon DocumentDB (with MongoDB compatibility).
- B. Create a new AMI that is configured with AWS Systems Manager Agent (SSM Agent). Use the new AMI to create a launch template for an Auto Scaling group. Use smaller instances in the Auto Scaling group. Create an Application Load Balancer to distribute traffic across the instances in the Auto Scaling group. Set the Auto Scaling group to scale based on CPU utilization. Migrate the database to Amazon Aurora MySQL.
- C. Change the EC2 instance type to a smaller Graviton powered instance type. Use the existing AMI to create a launch template for an Auto Scaling group. Create an Application Load Balancer to distribute traffic across the instances in the Auto Scaling group. Set the Auto Scaling group to scale based on CPU utilization. Migrate the database to Amazon DynamoDB.
- D. Move the application tier to containers by using Docker. Run the containers on Amazon Elastic Container Service (Amazon ECS) with EC2 instances. Create an Application Load Balancer to distribute traffic across the ECS cluster. Configure the ECS cluster to scale based on CPU utilization. Migrate the database to Amazon Neptune.

**Answer: B**

Explanation:

The most classic way of migrating such application: You create a new platform, you make the application more scalable by using an ASG + you migrate your MySQL server from an overloaded EC2 instance to a managed service.

#### **NEW QUESTION # 375**

A company is launching a new web application on Amazon EC2 instances. Development and production workloads exist in separate AWS accounts.

According to the company's security requirements, only automated configuration tools are allowed to access the production account. The company's security team wants to receive immediate notification if any manual access to the production AWS account or EC2 instances occurs.

Which combination of actions should a solutions architect take in the production account to meet these requirements? (Choose three.)

- A. Configure Amazon Simple Email Service (Amazon SES) to send email to the security team when an alarm is activated.
- B. Deploy EC2 instances in an Auto Scaling group. Configure the launch template to deploy instances without key pairs. Configure Amazon CloudWatch Logs to capture system access logs. Create an Amazon CloudWatch alarm that is based on the logs to detect when a user logs in to an EC2 instance.
- C. Turn on AWS CloudTrail logs in the application's primary AWS Region. Use Amazon Athena to query the logs for AwsConsoleSignIn events.
- D. Turn on AWS CloudTrail logs for all AWS Regions. Configure Amazon CloudWatch alarms to provide an alert when an AwsConsoleSignIn event is detected.
- E. Configure an Amazon Simple Notification Service (Amazon SNS) topic to send a message to the security team when an alarm is activated.
- F. Deploy EC2 instances in an Auto Scaling group. Configure the launch template to delete the key pair after launch. Configure Amazon CloudWatch Logs for the system access logs. Create an Amazon CloudWatch dashboard to show user logins over time.

**Answer: B,D,E**

## NEW QUESTION # 376

.....

Since the content of the examination is also updating daily, you will need real and latest Amazon SAP-C02 Exam Dumps to prepare successfully for the SAP-C02 certification exam in a short time. People who don't study from updated AWS Certified Solutions Architect - Professional (SAP-C02) (SAP-C02) questions fail the examination and loss time and money.

**SAP-C02 Exam Fee:** [https://www.prep4pass.com/SAP-C02\\_exam-braindumps.html](https://www.prep4pass.com/SAP-C02_exam-braindumps.html)

Our valid SAP-C02 vce are written by our IT experts who are specialized in the SAP-C02 pdf vce for many years and check the updating of SAP-C02 vce files everyday to make sure the best preparation material for you, Amazon Exam SAP-C02 Tests In order to improve self-ability and keep pace with the modern society, most people choose to attend a training class or get a certification of some fields, Amazon Exam SAP-C02 Tests Not all vendors dare to promise that if you fail the exam, we will give you a full refund.

This is not a true folder, Creation of members of a family SAP-C02 is akin to a production process and is enabled by an investment in tools and processes for the entire family.
