Scenario: A Citrix Administrator has configured an HTTP load-balancing virtual server with Least Response Time as the load-balancing algorithm.

What could be causing the virtual server to use the Round Robin load-balancing algorithm?

- A. The Citrix ADC configuration has NOT been saved yet.
- B. The virtual server is in startup round robin mode.
- C. The services that are bound to the HTTP virtual server are using the PING monitor.
- D. Least Response Time CANNOT be used as a load-balancing algorithm on an HTTP virtual server.

Answer: B

Explanation:

The Least Response Time method uses the response time of the monitor probes to determine the best service. However, this method requires that a monitor is bound to each service and that the monitor response times are recorded. Therefore, the virtual server uses the Round Robin method until each bound service has been probed by the monitor at least once. This mode is called startup round robin mode.
