CompTIA Security+ Certification Exam Sample Questions (Q310-Q315):

NEW QUESTION # 310

A systems administrator works for a local hospital and needs to ensure patient data is protected and secure. Which of the following data classifications should be used to secure patient data?

- A. Public
- B. Critical
- C. Private
- D. Sensitive

Answer: D

NEW QUESTION # 311

A newly identified network access vulnerability has been found in the OS of legacy IoT devices. Which of the following would best mitigate this vulnerability quickly?

- A. Replacement
- B. Patching
- C. Insurance
- D. Segmentation

Answer: D

Explanation:

Segmentation is a technique that divides a network into smaller subnetworks or segments, each with its own security policies and controls. Segmentation can help mitigate network access vulnerabilities in legacy IoT devices by isolating them from other devices and systems, reducing their attack surface and limiting the potential impact of a breach. Segmentation can also improve network performance and efficiency by reducing congestion and traffic. Patching, insurance, and replacement are other possible strategies to deal with network access vulnerabilities, but they may not be feasible or effective in the short term. Patching may not be available or compatible for legacy IoT devices, insurance may not cover the costs or damages of a cyberattack, and replacement may be expensive and time-consuming.

NEW QUESTION # 312

Which of the following digital forensics activities would a security team perform when responding to legal requests in a pending investigation?

- A. E-discovery
- B. Root cause analysis
- C. Firewall log export
- D. User provisioning

Answer: A

Explanation:

E-discovery involves identifying, preserving, and collecting electronically stored information to comply with legal requests during investigations.

NEW QUESTION # 313

A company wants to verify that the software the company is deploying came from the vendor the company purchased the software from. Which of the following is the best way for the company to confirm this information?

- A. Generate a hash of the files.
- **B. Validate the code signature.**
- C. Execute the code in a sandbox.
- D. Search the executable for ASCII strings.

Answer: B

Explanation:

Validating the code signature is the best way to verify software authenticity, as it ensures that the software has not been tampered with and that it comes from a verified source. Code signatures are digital signatures applied by the software vendor, and validating them confirms the software's integrity and origin. References:

NEW QUESTION # 314

A company has a website in a server cluster. One server is experiencing very high usage, while others are nearly unused. Which of the following should the company configure to help distribute traffic quickly?

- A. Server multiprocessing
- **B. Load balancer**
- C. Warm site
- D. Proxy server

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation: A load balancer distributes incoming traffic evenly across multiple servers to prevent any single server from becoming overloaded. This ensures high availability, scalability, and optimal performance of the company's website.

* Server multiprocessing (A) refers to the use of multiple processors within a single server but does not distribute traffic across multiple servers.

* A warm site (B) is a disaster recovery strategy, not a method for balancing real-time traffic.

* A proxy server (D) acts as an intermediary between users and web services but does not distribute server load.

Using a load balancer allows for efficient traffic management and prevents server overload.
