

ACD301 Prüfungen & ACD301 Testantworten

P.S. Kostenlose 2026 Appian ACD301 Prüfungsfragen sind auf Google Drive freigegeben von ITZert verfügbar:
https://drive.google.com/open?id=1jPGbSpr-wSK5tAY_hoPocpu9jJl7iayw

Unser ITZert verspricht, dass Sie die Appian ACD301 Prüfung einmalig bestehen und das Zertifikat von den Experten bekommen können. Denn unser ITZert stellt Ihnen die besten Prüfungsfragen und Antworten zur Appian ACD301 zur Verfügung. Und Sie können sich schrittweise auf die Prüfung gut vorbereiten. Unser ITZert verspricht, dass die Fragen und Antworten zur Appian ACD301 Zertifizierungsprüfung von ITZert Ihren Erfolg garantiert.

Appian ACD301 Prüfungsplan:

Thema	Einzelheiten
Thema 1	• Project and Resource Management: This section of the exam measures skills of Agile Project Leads and covers interpreting business requirements, recommending design options, and leading Agile teams through technical delivery. It also involves governance, and process standardization.
Thema 2	• Extending Appian: This section of the exam measures skills of Integration Specialists and covers building and troubleshooting advanced integrations using connected systems and APIs. Candidates are expected to work with authentication, evaluate plug-ins, develop custom solutions when needed, and utilize document generation options to extend the platform's capabilities.
Thema 3	• Platform Management: This section of the exam measures skills of Appian System Administrators and covers the ability to manage platform operations such as deploying applications across environments, troubleshooting platform-level issues, configuring environment settings, and understanding platform architecture. Candidates are also expected to know when to involve Appian Support and how to adjust admin console configurations to maintain stability and performance.
Thema 4	• Data Management: This section of the exam measures skills of Data Architects and covers analyzing, designing, and securing data models. Candidates must demonstrate an understanding of how to use Appian's data fabric and manage data migrations. The focus is on ensuring performance in high-volume data environments, solving data-related issues, and implementing advanced database features effectively.

Thema 5	Proactively Design for Scalability and Performance: This section of the exam measures skills of Application Performance Engineers and covers building scalable applications and optimizing Appian components for performance. It includes planning load testing, diagnosing performance issues at the application level, and designing systems that can grow efficiently without sacrificing reliability.

ACD301 Prüfungsfragen Prüfungsvorbereitungen, ACD301 Fragen und Antworten, Appian Lead Developer

Niemand will ein ganz ein leichtes Leben führen und in einer niedrigen Position wenig Gehalt beziehen. Eines Tages wird man vielleicht gekündigt oder in die Rente treten. Dieses Leben ist wirklich langweilig. Wollen Sie nicht ein vielfältiges Leben führen? Das macht nichts. Heute sage ich Ihnen eine Abkürzung zum Erfolg, nämlich, die Appian ACD301 Zertifizierungsprüfung zu bestehen. Mit dem Zertifikat können Sie ein besseres Leben führen und ein exzellenter IT-Expert werden und von anderen akzeptiert werden. Die Schulungsunterlagen zur Appian ACD301 Zertifizierungsprüfung von ITZert können ganz leicht Ihren Traum verwirklichen. Zögern Sie noch? Schicken Sie doch schnell Schulungsunterlagen zur Appian ACD301 Zertifizierungsprüfung von ITZert in den Warenkorb.

Appian Lead Developer ACD301 Prüfungsfragen mit Lösungen (Q41-Q46):

41. Frage

You are taking your package from the source environment and importing it into the target environment.

Review the errors encountered during inspection:

What is the first action you should take to Investigate the issue?

- A. Check whether the object (UUID ending in 18028931) is included in this package
- **B. Check whether the object (UUID ending in 7t00000i4e7a) is included in this package**
- C. Check whether the object (UUID ending in 18028821) is included in this package
- D. Check whether the object (UUID ending in 25606) is included in this package

Antwort: B

Begründung:

The error log provided indicates issues during the package import into the target environment, with multiple objects failing to import due to missing precedents. The key error messages highlight specific UUIDs associated with objects that cannot be resolved. The first error listed states:

"TEST_ENTITY_PROFILE_MERGE_HISTORY": The content [id=uuid-a-0000m5fc-f0e6-8000-9b01-011c48011c48, 18028821] was not imported because a required precedent is missing: entity [uuid=a-0000m5fc-f0e6-8000-9b01-011c48011c48, 18028821] cannot be found..." According to Appian's Package Deployment Best Practices, when importing a package, the first step in troubleshooting is to identify the root cause of the failure. The initial error in the log points to an entity object with a UUID ending in 18028821, which failed to import due to a missing precedent. This suggests that the object itself or one of its dependencies (e.g., a data store or related entity) is either missing from the package or not present in the target environment.

Option A (Check whether the object (UUID ending in 18028821) is included in this package): This is the correct first action. Since the first error references this UUID, verifying its inclusion in the package is the logical starting point. If it's missing, the package export from the source environment was incomplete. If it's included but still fails, the precedent issue (e.g., a missing data store) needs further investigation.

Option B (Check whether the object (UUID ending in 7t00000i4e7a) is included in this package): This appears to be a typo or corrupted UUID (likely intended as something like "7t000014e7a" or similar), and it's not referenced in the primary error. It's mentioned later in the log but is not the first issue to address.

Option C (Check whether the object (UUID ending in 25606) is included in this package): This UUID is associated with a data store error later in the log, but it's not the first reported issue.

Option D (Check whether the object (UUID ending in 18028931) is included in this package): This UUID is mentioned in a subsequent error related to a process model or expression rule, but it's not the initial failure point.

Appian recommends addressing errors in the order they appear in the log to systematically resolve dependencies. Thus, starting with the object ending in 18028821 is the priority.

42. Frage

Your application contains a process model that is scheduled to run daily at a certain time, which kicks off a user input task to a specified user on the 1st time zone for morning data collection. The time zone is set to the (default) `pm!timezone`. In this situation, what does the `pm!timezone` reflect?

- A. The time zone of the server where Appian is installed.
- **B. The default time zone for the environment as specified in the Administration Console.**
- C. The time zone of the user who is completing the input task.
- D. The time zone of the user who most recently published the process model.

Antwort: B

Begründung:

Comprehensive and Detailed In-Depth Explanation: In Appian, the `pm!timezone` variable is a process variable automatically available in process models, reflecting the time zone context for scheduled or time-based operations. Understanding its behavior is critical for scheduling tasks accurately, especially in scenarios like this where a process runs daily and assigns a user input task.

* Option C (The default time zone for the environment as specified in the Administration Console):

This is the correct answer. Per Appian's Process Model documentation, when a process model uses `pm!timezone` and no custom time zone is explicitly set, it defaults to the environment's time zone configured in the Administration Console (under System > Time Zone settings). For scheduled processes, such as one running "daily at a certain time," Appian uses this default time zone to determine when the process triggers. In this case, the task assignment occurs based on the schedule, and `pm!timezone` reflects the environment's setting, not the user's location.

* Option A (The time zone of the server where Appian is installed): This is incorrect. While the server's time zone might influence underlying system operations, Appian abstracts this through the Administration Console's time zone setting. The `pm!timezone` variable aligns with the configured environment time zone, not the raw server setting.

* Option B (The time zone of the user who most recently published the process model): This is irrelevant. Publishing a process model does not tie `pm!timezone` to the publisher's time zone. Appian's scheduling is system-driven, not user-driven in this context.

* Option D (The time zone of the user who is completing the input task): This is also incorrect. While Appian can adjust task display times in the user interface to the assigned user's time zone (based on their profile settings), the `pm!timezone` in the process model reflects the environment's default time zone for scheduling purposes, not the assignee's.

For example, if the Administration Console is set to EST (Eastern Standard Time), the process will trigger daily at the specified time in EST, regardless of the assigned user's location. The "1st time zone" phrasing in the question appears to be a typo or miscommunication, but it doesn't change the fact that `pm!timezone` defaults to the environment setting.

43. Frage

You need to export data using an out-of-the-box Appian smart service. Which two formats are available (or data generation)?

- A. XML
- **B. CSV**
- **C. Excel**
- D. JSDN

Antwort: B,C

Begründung:

The two formats that are available for data generation using an out-of-the-box Appian smart service are:

* A. CSV. This is a comma-separated values format that can be used to export data in a tabular form, such as records, reports, or grids. CSV files can be easily opened and manipulated by spreadsheet applications such as Excel or Google Sheets.

* C. Excel. This is a format that can be used to export data in a spreadsheet form, with multiple worksheets, formatting, formulas, charts, and other features. Excel files can be opened by Excel or other compatible applications.

The other options are incorrect for the following reasons:

* B. XML. This is a format that can be used to export data in a hierarchical form, using tags and attributes to define the structure and

content of the data. XML files can be opened by text editors or XML parsers, but they are not supported by the out-of-the-box Appian smart service for data generation.

* D. JSON. This is a format that can be used to export data in a structured form, using objects and arrays to represent the data. JSON files can be opened by text editors or JSON parsers, but they are not supported by the out-of-the-box Appian smart service for data generation. Verified References: Appian Documentation, section "Write to Data Store Entity" and "Write to Multiple Data Store Entities".

44. Frage

You are in a backlog refinement meeting with the development team and the product owner. You review a story for an integration involving a third-party system. A payload will be sent from the Appian system through the integration to the third-party system. The story is 21 points on a Fibonacci scale and requires development from your Appian team as well as technical resources from the third-party system. This item is crucial to your project's success. What are the two recommended steps to ensure this story can be developed effectively?

- A. Break down the item into smaller stories.
- B. Acquire testing steps from QA resources.
- C. Maintain a communication schedule with the third-party resources.
- D. Identify subject matter experts (SMEs) to perform user acceptance testing (UAT).

Antwort: A,C

Begründung:

Comprehensive and Detailed In-Depth Explanation:

This question involves a complex integration story rated at 21 points on the Fibonacci scale, indicating significant complexity and effort. Appian Lead Developer best practices emphasize effective collaboration, risk mitigation, and manageable development scopes for such scenarios. The two most critical steps are:

Option C (Maintain a communication schedule with the third-party resources):

Integrations with third-party systems require close coordination, as Appian developers depend on external teams for endpoint specifications, payload formats, authentication details, and testing support. Establishing a regular communication schedule ensures alignment on requirements, timelines, and issue resolution. Appian's Integration Best Practices documentation highlights the importance of proactive communication with external stakeholders to prevent delays and misunderstandings, especially for critical project components.

Option D (Break down the item into smaller stories):

A 21-point story is considered large by Agile standards (Fibonacci scale typically flags anything above 13 as complex). Appian's Agile Development Guide recommends decomposing large stories into smaller, independently deliverable pieces to reduce risk, improve testability, and enable iterative progress. For example, the integration could be split into tasks like designing the payload structure, building the integration object, and testing the connection—each manageable within a sprint. This approach aligns with the principle of delivering value incrementally while maintaining quality.

Option A (Acquire testing steps from QA resources): While QA involvement is valuable, this step is more relevant during the testing phase rather than backlog refinement or development preparation. It's not a primary step for ensuring effective development of the story.

Option B (Identify SMEs for UAT): User acceptance testing occurs after development, during the validation phase. Identifying SMEs is important but not a key step in ensuring the story is developed effectively during the refinement and coding stages.

By choosing C and D, you address both the external dependency (third-party coordination) and internal complexity (story size), ensuring a smoother development process for this critical integration.

45. Frage

You are deciding the appropriate process model data management strategy.

For each requirement, match the appropriate strategies to implement. Each strategy will be used once.

Note: To change your responses, you may deselect your response by clicking the blank space at the top of the selection list.

Archive processes 2 days after completion or cancellation.

appian

Select a match:

Processes that need to be available for 2 days after completion or cancellation, after which are no longer required nor accessible.
Processes that need to be available for 2 days after completion or cancellation, after which remain accessible.
Processes that remain available for 7 days after completion or cancellation, after which remain accessible.
Processes that need remain available without the need to unarchive.

Use system default (currently: auto-archive processes 7 days after completion or cancellation).
