NEW QUESTION # 68

Which is a reason for and physical security regulations meeting a mixed resistance?

Available Choices (select all choices that are correct)

- **A. There are a limited number of enforced cybersecurity and physical security regulations.**
- B. Regulations contain only informative elements.
- C. Cybersecurity risks can best be managed individually and in isolation.
- D. Regulations are voluntary documents.

Answer: A

Explanation:

Cybersecurity and physical security regulations are intended to provide guidance and requirements for protecting industrial control systems from various threats and risks. However, these regulations may face mixed resistance from different stakeholders for various reasons. One of the reasons is that there are a limited number of enforced cybersecurity and physical security regulations, especially at the international level. This means that some regions or countries may have more stringent or comprehensive regulations than others, creating inconsistencies and challenges for cross-border cooperation and compliance. Moreover, some regulations may be outdated or not aligned with the current best practices and standards, such as ISA/IEC

62443, which may limit their effectiveness and applicability. Therefore, some organizations may prefer to follow voluntary standards or frameworks, such as ISA/IEC 62443, rather than mandatory regulations, as they may offer more flexibility and adaptability to the specific needs and contexts of each industrial control system. NEW QUESTION # 69

How does ISA-62443-2-1 suggest integrating the IACS Security Program (SP) within an organization?

- A. Outsourcing all security responsibilities to third parties
- B. As a standalone system unrelated to other processes
- C. Only focusing on technical controls without process integration
- **D. By embedding it into organizational processes and the ISMS**

Answer: D

Explanation:

ISA/IEC 62443-2-1 explicitly requires that the IACS Security Program be integrated into the organization's overall management structure.

Step 1: Integration principle

The standard states that IACS security must align with business processes, governance, and enterprise security management rather than operate in isolation.

Step 2: Alignment with ISMS

Where an Information Security Management System (ISMS) exists, the IACS SP should be embedded within it to ensure consistent risk management, policy enforcement, and continuous improvement.

Step 3: Why other options are incorrect

Standalone security programs create silos. Full outsourcing violates asset owner accountability. Purely technical approaches ignore human and process factors.

Step 4: Operational outcome

Embedding the SP ensures sustainability, consistency, and executive oversight.

Therefore, the correct answer is by embedding it into organizational processes and the ISMS.

NEW QUESTION # 71

What is the FIRST step required in implementing ISO 27001?

Available Choices (select all choices that are correct)

- A. Implement strict security controls.
- B. Define an information security policy.
- C. Create a security management organization.
- D. Perform a security risk assessment.

Answer: D

Explanation:

The first step in implementing ISO 27001, an international standard for information security management systems (ISMS), is to perform a security risk assessment. This initial step is critical as it helps identify the organization's information assets that could be at risk, assess the vulnerabilities and threats to these assets, and evaluate their potential impacts. This risk assessment forms the foundation for defining appropriate security controls and measures tailored to the organization's specific needs. Starting with a risk assessment ensures that the security controls implemented are aligned with the actual risks the organization faces, making the ISMS more effective and targeted.

* Although ISO 27001 is not part of ISA/IEC 62443, it shares common principles in cybersecurity management by starting with a comprehensive understanding and assessment of security risks, which is a fundamental aspect in both standards for setting up effective security practices.
