## Fortinet EMEA Advanced Support Exam Sample Questions (Q17-Q22):

### NEW QUESTION # 17

What happens when a FortiGate detects a SYN flood attack?

- A. It drops all incoming packets
- B. It redirects traffic to a backup gateway
- C. It enables proxy-based inspection
- D. It applies rate limiting to SYN packets

**Answer: D**

Explanation:

When FortiGate detects a SYN flood attack, it applies rate limiting to SYN packets via a DoS policy, dropping excessive packets to mitigate the attack. It does not drop all packets (A), enable proxy inspection (B), or redirect traffic (D). Exact extract: "FortiGate mitigates SYN flood attacks using DoS policies, which apply rate limiting to SYN packets to prevent overwhelming the system."

**NEW QUESTION # 18**

What happens when a FortiGate's CPU enters conserve mode?

- A. All traffic is blocked
- B. Routing protocols are disabled
- C. New sessions are dropped
- D. **Proxy-based inspection is disabled**

**Answer: D**

Explanation:

When a FortiGate's CPU enters conserve mode due to high load, proxy-based inspection (e.g., web filtering, DLP) is disabled to reduce resource usage, while flow-based inspection continues. Traffic isn't fully blocked (A), new sessions may still be processed (C), and routing protocols (D) are unaffected. Exact extract: "In conserve mode, FortiGate disables proxy-based inspection to reduce CPU and memory load, switching to flow-based inspection to maintain performance."

**NEW QUESTION # 19**

A Company is running an outdated version of a Webserver software that is vulnerable to multiple code execution and injection attacks. Which Security feature can protect the Webserver until the security patches are applied?

- A. Intrusion Detection System
- B. **Intrusion Prevention System**
- C. Anti rootkit Protection
- D. Anti-virus Protection

**Answer: B**

Explanation:

An Intrusion Prevention System (IPS) actively blocks malicious traffic, such as code execution or injection attacks, by matching against known signatures or anomalies, protecting the webserver until patches are applied. Intrusion Detection System (IDS) only detects and alerts, not blocks. Anti-virus and anti-rootkit are less effective for web-based attacks. The original document's answer B is incorrect, as IDS does not prevent attacks. Exact extract: "IPS provides active protection by blocking malicious traffic based on signatures or anomaly detection... Unlike IDS, which only detects and alerts, IPS can drop packets to prevent attacks like code execution or SQL injection."

**NEW QUESTION # 20**

Firewall is performing stateful inspection for TCP traffic between Client 10.0.0.21 and Server 172.16.1.200.

### Exhibit: 1

### Exhibit: 2

- A. The ACK was not supposed to be sent to client 10.0.0.21
- B. Three way handshake was not completed
- C. Traffic is Asymmetric and not allowed by the Firewall
- D. Traffic should be allowed

### Answer: B

Explanation:

Stateful inspection requires a complete TCP three-way handshake (SYN, SYN-ACK, ACK) to establish a session in the firewall's state table. If the handshake is incomplete (e.g., missing ACK), the session is not established, and traffic is dropped. The question implies a stateful firewall scenario where traffic is blocked, likely due to an incomplete handshake. Asymmetric traffic (B) or incorrect ACK (A) are not indicated without further context, and C is incorrect if the handshake fails. Exact extract: "Stateful inspection ensures that a TCP three-way handshake is completed before allowing traffic... If the handshake is not completed, FortiGate drops the packets as invalid."

### NEW QUESTION # 21

Client is connected to firewall via link with MTU 1500 bytes, server is connected to firewall via link with MTU 1496 bytes. The firewall is rewriting both sender and receiver tcp-mss to 1450 bytes. What maximum size of IP packets are we going to see when client connects to server?

- A. 1496 bits
- B. 1500 bits
- C. 1450 bytes
- D. 1500 bytes
- E. 1496 bytes
- F. 1450 bits

### Answer: C

#### Explanation:

The TCP MSS (Maximum Segment Size) defines the maximum TCP payload size, excluding headers. When the firewall sets MSS to 1450 bytes, the TCP segment size is limited to this value. For IP packets, the total size includes the TCP header (20 bytes) and IP header (20 bytes), so  $1450 (\text{MSS}) + 20 (\text{TCP}) + 20 (\text{IP}) = 1490$  bytes, which fits within both link MTUs (1500 and 1496 bytes). Thus, the maximum IP packet size is not limited by the link MTUs but by the MSS, adjusted for headers. Options C and F (bits) are incorrect units; A and B exceed the MSS limit. Exact extract: 'The TCP MSS is adjusted to prevent fragmentation... FortiGate can rewrite the MSS in TCP SYN packets to ensure the total IP packet size (including IP and TCP headers) does not exceed the configured value.'

#### NEW QUESTION # 22

.....

Just as an old saying goes, it is better to gain a skill than to be rich. Contemporarily, competence far outweighs family backgrounds and academic degrees. One of the significant factors to judge whether one is competent or not is his or her EMEA-Advanced-Support certificates.
