問題 #35

Which stage focuses on validating that the automation meets business expectations in a real-world scenario?

- A. Kickoff
- B. Solution Design
- C. Deployment
- **D. User Acceptance Testing (UAT)**

答案: D

解題說明:

The User Acceptance Testing (UAT) stage is where the automation is validated to ensure it meets business expectations and performs correctly in a real-world scenario. UAT is conducted by end users or business stakeholders using defined test cases and data that

mimic live operations.

The goals of this stage are to:

- * Confirm that the automation performs as designed
- * Verify that business rules and logic are correctly implemented
- * Identify any defects or unexpected behavior
- * Collect user feedback before deployment

The Automation Developer is responsible for fixing any issues found during UAT. A successful UAT ensures the automation is ready for deployment and has the confidence of the business users.

問題 #36

Which three roles from the Implementation Team participate in the Kickoff stage?

- A. Project Manager, Business Analyst, Automation Developer
- B. Business Analyst, Solution Architect, Client SME
- C. Automation Developer, Project Manager, UAT Tester
- **D. Project Manager, Solution Architect, Infrastructure Engineer**

答案: D

解題說明:

The three Implementation Team roles that participate in the Kickoff stage are:

- * Project Manager
- * Solution Architect
- * Infrastructure Engineer

In this stage, the Project Manager ensures that responsibilities and timelines are clear, the Solution Architect begins understanding the technical landscape, and the Infrastructure Engineer initiates discussions about access, environments, and setup requirements. Together, they define the project plan, infrastructure needs, high-level scope, and stakeholder involvement. Their early involvement ensures that any blockers (especially around access and infrastructure) are addressed from the start, minimizing risks and delays in later stages.

問題 #37

Who is primarily responsible for building automations based on business requirements in UiPath projects?

- A. Business Analyst
- **B. Automation Developer**
- C. Project Manager
- D. Infrastructure Engineer

答案: B

解題說明:

The Automation Developer is primarily responsible for building automations based on the business requirements that have been analyzed and documented in the Process Definition Document (PDD) and further detailed in the Solution Design Document (SDD). Using UiPath Studio and related tools, the developer creates workflows that follow best practices, coding standards, and modular architecture. They also implement exception handling, data manipulation, integration with applications, and orchestrator configurations as required.

In addition to development, they participate in unit testing, User Acceptance Testing (UAT) support, and Hypercare, making adjustments based on feedback or defects found. Their role is critical in turning the design into a functional automation solution that meets business expectations.

問題 #38

Which of the following best describes a human-in-the-loop automation model?

- **A. Unattended robots request user input at certain steps**
- B. Users control the robot's every action in real time
- C. Robots only work when manually triggered
- D. Robots run independently without user input

答案： A

解題說明：

In a human-in-the-loop automation model, unattended robots perform processes automatically but pause and request user input when required. This model allows robots to handle repetitive and rule-based tasks while humans intervene in scenarios that require decision-making or approval.

UiPath supports human-in-the-loop functionality using tools such as UiPath Action Center, where users can review exceptions, provide additional data, or make business decisions. Once the input is received, the automation resumes and completes the rest of the process autonomously.

This model is particularly useful for processes involving compliance checks, approvals, or document verification - blending the speed of automation with human judgment where necessary.

問題 #39

What is the eighth and final stage in the UiPath Automation Implementation Methodology?

- A. Project Closure
- B. User Acceptance Testing (UAT)
- C. Deployment and Hypercare
- D. Process Analysis

答案： A

解題說明：

The eighth and final stage in the UiPath Automation Implementation Methodology is Project Closure. This stage ensures the formal completion of the automation project, including documentation, knowledge transfer, performance reviews, and stakeholder sign-offs. At this point, the automation has been developed, tested, deployed, and stabilized. The focus shifts to closing open items, confirming that all success criteria have been met, and collecting feedback from both the Client Team and Implementation Team. Any lessons learned are documented, which can be reused for future automation initiatives.

Project Closure is critical to wrap up the engagement in a structured way. It includes archiving documents, performing final quality checks, and transitioning maintenance responsibilities. Involving all stakeholders in this phase ensures transparency, accountability, and a complete handover of the automated process into a business-as-usual state.
