Cohesity Certified Protection Professional - NetBackup Appliances Sample Questions (Q140-Q145):

NEW QUESTION # 140

Which feature is enabled after adding a master server to the Trusted Master Servers tab?

- A. targeted Auto Image Replication
- B. backup of clients in other master server domains
- C. remote catalog backups
- D. remote console to another master server

Answer: A

NEW QUESTION # 141

What is the name of the feature that lets you recover the NetBackup catalog in case of a disaster?

- A. Catalog Backup Wizard
- B. Catalog Disaster Recovery Wizard

- C. Catalog Restore Wizard
- D. Catalog Recovery Wizard

Answer: D

NEW QUESTION # 142

An administrator is attempting to configure a new backup policy using synthetic backups. When creating a new full backup schedule, the Synthetic backup option is greyed out and therefore unable to be selected.

What must the administrator do to the policy to make the Synthetic backup option available for selection?

- A. create a full backup schedule with Accelerator forced rescan enabled
- B. select a backup destination that supports synthetic backups
- C. enable Collect true image restore information with move detection
- D. create a differential or cumulative incremental backup schedule

Answer: C

NEW QUESTION # 143

How can you manage NetBackup disk and cloud storage?

- A. Use the NetBackup administration console to create and manage storage policies.
- B. Use the NetBackup command line to manage storage.
- C. Use the NetBackup administration console to allocate storage resources to backup jobs.

Answer: A,C

NEW QUESTION # 144

A backup job fails with the status code of 96. To troubleshoot the failure, the administrator wants to view the application log files written by the NetBackup Resource Broker.

Which command should the administrator run to find the date, time and actual message text from the log file?

- A. vxlogview -p 50936 --display D,T,m
- B. vxlogview -o 118 -d D,T,x
- C. vxlogview -p 51216 -d m,w,x
- D. vxlogview -o 118 --display D,T,w

Answer: B

Explanation:

The correct command is vxlogview -o 118 -d D,T,x. Status code 96 commonly indicates that NetBackup could not allocate required media or storage resources, so troubleshooting should focus on the NetBackup Resource Broker, also known as nbrb. Cohesity NetBackup documentation identifies originator ID 118 as nbrb, the NetBackup Resource Broker, which maintains available resource information and locates the physical and logical resources needed for backup and tape restore operations. The vxlogview command is the supported utility for reading unified logs, because unified log files are binary and must be assembled by vxlogview. The -o 118 option filters log records for the Resource Broker originator, while -d D,T,x displays the required fields: date, timestamp, and actual log message text. The command reference defines D as display date, T as display timestamp, and x as display actual log message text. Option C is incorrect because w displays who logged diagnostic/debug messages, not the actual message text. References/topics: NetBackup unified logging, vxlogview, originator IDs, nbrb Resource Broker logging, and status 96 resource allocation troubleshooting.

NEW QUESTION # 145

.....

The modern world is becoming more and more competitive and if you are not ready for it then you will be not more valuable for job providers. Be smart in your career decision and enroll in Cohesity Certified Protection Professional - NetBackup Appliances COH-285 Certification Exam and learn new and in demands skills.
