Vce Terraform-Associate-004 Files & Terraform-Associate-004 Actual Exam

Terraform-Associate-004 exam dumps provided by Actual4Dumps are tested through practice, and are the most correct and the newest practical Terraform-Associate-004 test dumps. Our Actual4Dumps can provide accurate Terraform-Associate-004 certification training questions based on extensive research and the experience of real world to make you pass Terraform-Associate-004 Certification Exam in a short time. If you purchase our Terraform-Associate-004 exam dumps, we will offer free update service within one year.

HashiCorp Certified: Terraform Associate (004) (HCTA0-004) Sample Questions (Q312-Q317):

NEW QUESTION # 312

terraform validate confirms the syntax of Terraform files.

- A. False

- **B. True**

Answer: B

Explanation:

terraform validate checks for syntax errors and internal consistency in the configuration files.

However, it does not check if resource configurations are valid with the provider.

Official Terraform Documentation Reference:

terraform validate - HashiCorp Documentation

NEW QUESTION # 313

terraform init retrieves and caches the configuration for all remote modules.

- A. True
- **B. False**

Answer: B

Explanation:

terraform init retrieves and caches providers and modules, but only for explicitly declared modules in the configuration.

If a module is added or updated, terraform init needs to be re-run to download the new version.

Terraform does not automatically cache all remote modules unless they are explicitly referenced in the configuration.

Official Terraform Documentation Reference:

terraform init - HashiCorp Documentation

NEW QUESTION # 314

How is terraform import run?

- A. As a part of terraform init
- B. As a part of terraform plan
- C. All of the above
- **D. By an explicit call**
- E. As a part of terraform refresh

Answer: D

Explanation:

The terraform import command is not part of any other Terraform workflow. It must be explicitly invoked by the user with the appropriate arguments, such as the resource address and the ID of the existing infrastructure to import. References = [Importing Infrastructure]

NEW QUESTION # 315

Which of the following should you add in the required_providers block to define a provider version constraint?

- A. version >= 3.1
- **B. version = ">= 3.1"**
- C. version ~> 3.1

Answer: B

Explanation:

Rationale for Correct Answer (C):

This ensures compatibility with Terraform's syntax.

Analysis of Incorrect Options:

A, B: Incorrect syntax, missing quotes or wrong operator format.

C: Correct Terraform syntax.

Key Concept:

Correct syntax in provider version constraints ensures reproducibility.

Reference:

Terraform Exam Objective - Manage Terraform Resources and Providers.

NEW QUESTION # 316

Which argument can you set on a module block to prevent Terraform from updating the module's configuration during an init or get operation?

- A. version
- B. count
- C. lifecycle
- D. source

Answer: A

Explanation:

Rationale for Correct answer: Setting the module version (for registry modules) pins the module release Terraform will use. By pinning the version, Terraform will not "update" the module to newer releases during terraform init -upgrade or terraform get -update unless you change the version constraint. This is the standard way to control module updates and keep module code stable across runs.

Analysis of Incorrect Options (Distractors):

B (lifecycle): lifecycle is for resources, not module blocks.

C (count): count controls how many module instances are created; it doesn't control module source updates.

D (source): source tells Terraform where the module comes from; it doesn't prevent updates by itself (a VCS/ref pin would be done in the source string, but the module block argument that achieves this in the typical module workflow is version for registry modules).

Key Concept: Module version pinning to control module upgrades.
