The format name of Channel Partner Program Identity-and-Access-Management-Architect practice test questions is Salesforce PDF Questions file, desktop practice test software, and web-based practice test software. Choose the right type of Channel Partner Program Salesforce Certified Identity and Access Management Architect Identity-and-Access-Management-Architect Practice Exam Questions that fit your Salesforce Identity-and-Access-Management-Architect exam preparation requirement and budget and start preparation without wasting further time.

To become a Salesforce Certified Identity and Access Management Architect, candidates must pass a rigorous exam that covers a wide range of topics related to identity and access management. This includes topics such as authentication, authorization, user provisioning, single sign-on (SSO), and identity federation. Candidates are also tested on their knowledge of Salesforce products such as Salesforce Identity, Salesforce Shield, and Salesforce Platform Encryption.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q10-Q15):

NEW QUESTION # 10

An identity architect's client has a homegrown identity provider (IdP). Salesforce is used as the service provider (SP). The head of IT is worried that during a SP initiated single sign-on (SSO), the Security Assertion Markup Language (SAML) request content will be altered.

What should the identity architect recommend to make sure that there is additional trust between the SP and the IdP?

- A. Ensure that the Issuer and Assertion Consumer service (ACS) URL is properly configured between SP and IDP.
- **B. Encrypt the SAML Request using certification authority (CA) signed certificate and decrypt on IdP.**
- C. Ensure that there is an HTTPS connection between IDP and SP.
- D. Ensure that on the SSO settings page, the "Request Signing Certificate" field has a self-signed certificate.

Answer: B

Explanation:

Explanation

Encrypting the SAML Request using a CA signed certificate and decrypting it on the IdP ensures that the request content is not altered or tampered with during transit. This also adds an extra layer of security and trust between the SP and the IdP. References: SAML Single Sign-On Overview, SAML Assertion Encryption

NEW QUESTION # 11

Which two security risks can be mitigated by enabling Two-Factor Authentication (2FA) in Salesforce?

Choose 2 answers

- **A. Users choosing passwords that are the same as their Facebook password.**
- B. Users creating simple-to-guess password reset questions.
- C. Users leaving laptops unattended and not logging out of Salesforce.
- **D. Users accessing Salesforce from a public Wi-Fi access point.**

Answer: A,D

Explanation:

Enabling Two-Factor Authentication (2FA) in Salesforce can mitigate the security risks of users accessing Salesforce from a public Wi-Fi access point or choosing passwords that are the same as their Facebook password. 2FA is an additional layer of protection beyond your password that requires users to verify their identity with another factor, such as a mobile app, a security key, or a verification code. This can prevent unauthorized access even if the user's password is compromised or guessed by a malicious actor. The other options are not directly related to 2FA, but rather to user behavior or password policies.

NEW QUESTION # 12

Northern Trail Outfitters (NTO) employees use a custom on-premise helpdesk application to request, approve, notify, and track access granted to various on-premises and cloud applications, including Salesforce.

Salesforce is currently used to authenticate users.

How should NTO provision Salesforce users as soon as they are approved in the helpdesk application with the approved profiles and permission sets?

- A. Use a login flow to query the helpdesk to validate user status.

- B. Have the helpdesk initiate an IdP-initiated Just-in-Time provisioning Security Assertion Markup Language flow.
- C. Use Salesforce Connect to integrate with the helpdesk application.
- **D. Build an integration that performs a remote call-in to the Salesforce SOAP or REST API.**

Answer: D

Explanation:

Explanation

Building an integration that performs a remote call-in to the Salesforce SOAP or REST API is the best way to provision Salesforce users as soon as they are approved in the helpdesk application. The API allows creating and updating user records with the approved profiles and permission sets. The other options are either not suitable or not sufficient for this use case. References: User SOAP API Developer Guide, User REST API Developer Guide

NEW QUESTION # 13

Users logging into Salesforce are frequently prompted to verify their identity.

The identity architect is required to provide recommendations so that frequency of prompt verification can be reduced.

What should the identity architect recommend to meet the requirement?

- A. Implement a single sign-on for Salesforce using an external identity provider.
- B. Implement 2FA authentication for the Salesforce org.
- **C. Set trusted IP ranges for the organization.**
- D. Implement multi-factor authentication for the Salesforce org.

Answer: C

NEW QUESTION # 14

Universal Containers (UC) uses Salesforce to allow customers to keep track of the order status. The customers can log in to Salesforce using external authentication providers, such as Facebook and Google. UC is also leveraging the App Launcher to let customers access an of platform application for generating shipping labels.

The label generator application uses OAuth to provide users access. What license type should an Architect recommend for the customers?

- A. Identity license
- **B. External Identity license**
- C. Customer Community license
- D. Customer Community Plus license

Answer: B

Explanation:

Explanation

D is correct because External Identity license is designed for customers who need to log in to Salesforce using external authentication providers, such as Facebook and Google. External Identity license also supports App Launcher, which allows customers to access other applications from Salesforce using OAuth or OpenID Connect .

A is incorrect because Customer Community license is designed for customers who need to access data and records in Salesforce, such as cases, accounts, and contacts. Customer Community license does not support App Launcher or external authentication providers.

B is incorrect because Identity license is designed for employees who need to access multiple applications from Salesforce using SSO and App Launcher. Identity license does not support external authentication providers or customer data access.

C is incorrect because Customer Community Plus license is designed for customers who need to access data and records in Salesforce, as well as collaborate with other customers and partners. Customer Community Plus license does not support App Launcher or external authentication providers.
