SPLK-1002 Latest Dumps Sheet - SPLK-1002 Valid Test Questions

We have created a number of reports and learning functions for evaluating your proficiency for the Splunk Core Certified Power User Exam (SPLK-1002) exam dumps. In preparation, you can optimize Splunk Core Certified Power User Exam (SPLK-1002) practice exam time and question type by utilizing our Splunk SPLK-1002 Practice Test software. ExamsLabs makes it easy to download Splunk SPLK-1002 exam questions immediately after purchase. You will receive a registration code and download instructions via email.

Splunk Core Certified Power User Exam Sample Questions (Q269-Q274):

NEW QUESTION # 269

Calculated fields can be based on which of the following?

- A. Extracted fields
- B. Tags
- C. Output fields for a lookup

- D. Fields generated from a search string

Answer: A

Explanation:

"Calculated fields can reference all types of field extractions and field aliasing, but they cannot reference lookups, event types, or tags."

NEW QUESTION # 270

Why would the following search produce multiple transactions instead of one?

```
index=security sourcetype=linux_secure failed earliest=-60d latest=-1d
| transaction src_ip
| stats list(eventcount) as num_events sum(eventcount) as total_events by src_ip
```

src	num_events	total_events
107.3.146.207	1000 1000 1000 405	3405
108.65.113.83	1000 120	1120
109.169.32.135	1000 1000 79	2079
11.17.160.129	1000 1000 238	2238

- A. The transaction command has a limit of 1000 events per transaction.
- B. The stats list () function is used.
- C. The transaction and commands cannot be used together.
- **D. The maxspan option is not included.**

Answer: D

Explanation:

In Splunk, the transaction command is used to group events that share common characteristics into a single transaction. By default, the transaction command groups all matching events into a single transaction.

However, you can use the maxspan option to limit the time span of the transactions. If the time span between the first and last event in a transaction exceeds the maxspan value, the transaction command will start a new transaction.

Therefore, if the maxspan option is not included in the search, the transaction command might produce multiple transactions instead of one if the time span between the first and last event in a transaction exceeds the default maxspan value.

Here is an example of how you can use the maxspan option in a search:

index=main sourcetype=access_combined | transaction someuniquefield maxspan=1h In this search, the transaction command groups events that share the same someuniquefield value into a single transaction, but only if the time span between the first and last event in the transaction does not exceed 1 hour. If the time span exceeds 1 hour, the transaction command will start a new transaction.

NEW QUESTION # 271

When would transaction be used instead of stats?

- A. To have a faster and more efficient search.
- **B. To group events based on start/end values.**
- C. To group events based on a single field value.
- D. To see results of a calculation.

Answer: B

Explanation:

The transaction command is used to group events that are related by some common fields or conditions, such as start/end values, time span, or pauses. The stats command is used to calculate statistics on a group of events by a common field value.

NEW QUESTION # 272

Which delimiters can the Field Extractor (FX) detect? (select all that apply)

- A. Tabs
- B. Commas
- C. Pipes
- D. Spaces

Answer: A,C,D

NEW QUESTION # 273

Information needed to create a GET workflow action includes which of the following? (select all that apply.)

- A. A label that will appear in the Event Action menu at search time.
- B. A name for the URI where the user will be directed at search time.
- C. A name of the workflow action
- D. A URI where the user will be directed at search time.

Answer: A,C,D

Explanation:

Reference:

Information needed to create a GET workflow action includes the following: a name of the workflow action, a URI where the user will be directed at search time, and a label that will appear in the Event Action menu at search time. A GET workflow action is a type of workflow action that performs a GET request when you click on a field value in your search results. A GET workflow action can be configured with various options, such as:

A name of the workflow action: This is a unique identifier for the workflow action that is used internally by Splunk. The name should be descriptive and meaningful for the purpose of the workflow action.

A URI where the user will be directed at search time: This is the base URL of the external web service or application that will receive the GET request. The URI can include field value variables that will be replaced by the actual field values at search time. For example, if you have a field value variable `ip`, you can write it as `http://example.com/ip=$ip` to send the IP address as a parameter to the external web service or application.

A label that will appear in the Event Action menu at search time: This is the display name of the workflow action that will be shown in the Event Action menu when you click on a field value in your search results. The label should be clear and concise for the user to understand what the workflow action does.

Therefore, options A, B, and C are correct.

NEW QUESTION # 274

.....

Our company employs a professional service team which traces and records the popular trend among the industry and the latest update of the knowledge about the SPLK-1002 exam reference. We give priority to keeping pace with the times and providing the advanced views to the clients.
